Green-Paper:

*The State and Challenges of OER in Brazil: from readers to writers?*

Carolina Rossini
V.0.0 October/2009
V.0.1 January/2010
This paper was prepared in the context of the "Brazilian Project on Open Educational Resources: Challenges and Perspectives" (The OER–Br Project). The OER–Br Project is one of the first projects in Brazil that tries to appropriate the international discussion around Open Educational Resources to the Brazilians reality and perspectives. This project is funded by the Open Society Institute.

The objectives of the OER–Br Project include:

1) The development of a Green Paper mapping the situation of OER in Brazil trying to understand how the educational policy is favorable to OER and how the public money flows into educational materials (mainly textbooks). This paper will also develop some case studies of Brazilian projects that can be classified inside the OER definition. The idea is to reach a series of recommendations for policy on OERs for Brazil;

2) The collaborative development of a toolkit focus in OER to be later distributed and promoted in Brazil. In this toolkit the idea is to clarify concepts around OER, put examples of strategies, Intellectual Property issues – such as licensing, tools and business models around OER, and also best practices that are emerging in the OER community.

3) Contribute to the development of a network of international initiatives and Brazilian initiatives on open educational resources.

4) Hold an OER–BRAZIL final conference to show results, discuss recommendations, present international and national projects. The idea was to transform the conference in a working group and/or draft some consensus from the conference targeting a future public policy for OER in Brazil. The conference happened in October/2009 and its agenda and presentations can be seen here: http://opened.creativecommons.org/Brazilian_Project_on_OER (English and Portuguese)

5) Support the development of a Brazilian community focused on Open Educational Resources. Check the progress at http://br.wikimedia.org/wiki/Rea (Portuguese and more current, includes spin–off projects)

I want to thank the Open Society Institute for the financial support and especially I want to thank Melissa Hagemann for her constant support, enthusiasm and leadership. I want to thank to the institutional support of the Fundacao Getulio Vargas Law School in Sao Paulo and its wonderful team of professors and people, who supported and assisted the OER–Br Project. I also want to thank John Wilbanks, my husband and interlocutor. I want to thank all the people that agreed to give me feedback on the first version of this paper. Finally, I want to thank the great Brazilian OER community, a smart, active and fun community!

About the author:

Carolina Rossini is a Brazilian attorney and international intellectual activist, seasoned manager and public speaker. Experienced in intellectual property, international development, Internet policy, the digital commons, open educational resources, open access, and the impact of technology on cultures of the North and the South.

She is currently a fellow at the Berkman Center for Internet and Society at Harvard University, coordinating the Industrial Cooperation Research Project and an OSI grantee coordinating the OER–Br Project. She is also the Community Coordinator at MINDS, a Research Associate at IQsensato and a fellow at Diplo Foundation. She does a ton of pro–bono work for institutions that want to develop strategies around the “commons”. In the past, Carolina coordinated the Latin America chapter of Open Business Models and was part of Creative Commons Brazil. She taught IP law and coordinated the Clinical Program at Fundacao Getulio Vargas Law School. Before joining the academic life, Carolina was a counsel for almost 7 years at Telefonica Telecommunications Group in Brazil, having worked in Brazil and Spain.

She holds a LL.M. in Intellectual Property from Boston University (2008) with honors, and degrees from the Sao Paulo State University–UNESP (Master in International Negotiations – 2006), University of Sao Paulo (Bachelor in Law – 2000), Instituto de Empresa–IE, Spain (MBA in E–Business – 2004), Specialist in Industrial Property (University of Buenos Aires – 2006) and other certificate courses. She also studied international relations at the Catholic University in Sao Paulo.

EXECUTIVE SUMMARY

Enormous investments are being made worldwide to integrate the Internet into educational processes: broadband to connect schools, laptops distributed to teachers at very competitive prices, and computer laboratories built in schools. However, the focus is nearly always on infrastructure. This does not create the ideal foundation for educational innovation. The diverse elements of hardware, software, content, and applications all play a role in innovation on the network, and in the success or failure of creation of cultures of collaboration and reuse aligned with modern education theories.

Treating the elements as separate items rather than a connected ecosystem misses a key dimension of the discussion, which is how the infrastructure and content are used in education and how the culture of collaborative work can transform both teachers and learners. For this it is essential to talk about the content issues. Content means everything from theses to software to modules to textbooks to research articles, and content issues cover a wide variety of ground from teacher training to intellectual property rights, content price, access privileges, access to taxpayer-funded educational resources, technical standards, and more.

Education policy and projects that combine infrastructure investment with a coherent “network” approach to content are the most likely to have significant positive impact and realize the goals of the policy and a more inclusive education capable of inserting the learner in the Information Society. The ability of the Internet to create radical increases in innovation is not an accident – but it is also not guaranteed to create educational value simply through the networking of computers and course descriptions. A favorable environment and a set of incentives and measurements need to be developed. The “generative” effect of the networked society we associate with explosive innovation comes from the combination of open technologies, software platforms that allow creative programming, the right to make creative re-use of content, and the widespread democratization of the skills and tools required to exercise all of those rights.

As nations worldwide move to implement digital education projects, and developing nations in particular look to use the Internet to replace outdated and insufficient educational systems, an examination of existing work is in order. It is important to provide a map of lessons learned, and to understand how existing projects can be connected to one another to create the largest possible impact for both educators and learners. Our goal with the Green-Paper that this Executive Summary runs through is to examine these broad issues within the lens of a detailed examination of the Brazilian experience applying ICTs to education in policy, technology, pedagogy, and the impact of the emerging “open educational resources” in both theory and practice.

OER

A significant attribute of most educational resources is that they are restricted to a set of traditional players with access through institutional employment or enrollment. As such, many educational materials can cost a lot to access and if free to access, copyright restrictions block creative re-use, restricting the actions of appropriation and remix essential to modern pedagogical activity. This follows the economic market for educational resources, which is a typical content sales market. Educational materials are packaged up as copyrighted goods that have to be bought from a store or accessed through course fees, repositories with restricted access, or directly from the manufacturer–publisher.
Although free provision of educational material is often provided through governmental programs guarantees access for those attending public schools, problems regarding diversity, appropriateness, timeliness, and quality of these materials are common. This approach also ignores learners outside the traditional system, such as self-learners. This situation is even more severe in developing countries such as Brazil, where, among other problems, teachers frequently need more and better training, resources are often scarce or non-existent, public library buildings are falling apart, and cost of textbooks or complementary resources are prohibitive for many college students and their families.

The philosophy of open educational resources (OERs) places educational materials as common and public goods from which all should benefit, but most especially those who receive the least benefit and support from current systems of education, whether publicly or privately funded. This view is supported by the notion that sees knowledge itself as a collective social product that naturally forms a commons that needs to be accessible to all. Scholars see evidence of this commons formation in free software, access to scholarly literature, “free culture” and other areas in which the network has both disrupted traditional “read only” culture and enabled the emergence of an empowered individual creator existing within a community of creators.

A key element of these communities is the reduction of the cost of copying and distributing new content drops to nearly zero after its production. In the education context, this change allows for the debate to shift on educational resources, which are often publicly funded. The question then becomes: once the public has paid the resources (through taxes), how should they be managed and made available?

OER encourages and enables the open production, sharing of, and access to educational content and resources. This alone is a valuable societal good, increasing the value of investments made in education. But OER creates the opportunity for a more fundamental and transformative change: the move from passive consumption of educational resources to the formal engagement of educators and learners in the creative process of education content development itself.

The idea behind OER is clearly stated in the Cape Town Open Education Declaration:

- Open education policy: Governments, school boards, colleges and universities should make taxpayer-funded educational resources OER.

- Open content licenses: OER should be freely shared through open licenses, which facilitate use, revision, translation, improvement and sharing.

- Collaborative production: Educators and students can participate in creating, using, adapting and improving OER.

Brazil

Brazil sits at a decisive moment to improve education. With a record budget of more than 41 billions of Reais in the hands of the Ministry of Education, a major national effort to connect the public network of schools to the Internet and to foster the adoption of digital educational tools, in addition to an increased investment in research in higher education, is taking place.
In particular, the discussion we set with this Green Paper is an attempt to structure the open educational resources debate as it relates to access to publicly funded educational resources and innovative approaches to learning. There are four axes of structure to the OER context in Brazil, echoing internal structures of traditional education as well as the new opportunities afforded by the move to digital networks for dissemination and use of educational materials:

- public access to educational materials in general, as an open education strategy to include the individual, the family, the community and the whole society in the process of learning and of collaborative knowledge production;
- the economic cycle of educational materials production and its impact on the “right of citizens to learn”;
- the possible benefits OER may bring to learning strategies, the production of educational resources more sensitive to issues driven regional diversity and regional standards of quality;
- the impact of digital, online, open resources on teachers’ continuous professional development.

Wide dissemination of education contributes to more inclusive and cohesive societies, fosters equal opportunities and innovation in line with the priorities of a renewed social agenda focused on the knowledge society. In this sense, this study brings a series of recommendations to foster this dialogue.

Recommendations

The recommendations we set come from a deep analysis of the structure, market and policies molding education in Brazil, which follows in this paper. Additionally, some of the recommendations are built after a deep analysis of current projects – lead by the government and by private parties – to provide educational resources to a broader group of individuals. In this sense, we scrutinized 11 Brazilian projects that have in their mission to provide educational resources in an “open and more inclusive” fashion.

The conclusions we build call the attention for the lack of a long-term design and lack of uniformity and interoperability of resources, what generates insecurity in regard to their use and also a probable inefficient use of public resources in some cases. Additionally, we developed a case study on the problematic issue of access to textbooks in Brazil1. Also, we explain the role of copyright within the educational resources sector and how it affects access to knowledge, and recommendations are also drawn from this analysis.

We established three pillars regarding the intersection of ICT and educational policy, assuming that the highest return on public investment in education ensues when the following principles related to the interaction of contents and networks are reality:

1. **Public access to publicly funded educational materials**: Publicly funded educational materials, both the teaching materials and the

---

1 In regard to matter of price of and access to textbooks in Brazil, we also recommend the review and reports developed by the Research Center for Access to Information and Public Policy - GPOPAI, at University of Sao Paulo, at http://www.gpopai.usp.br/wiki/index.php/P%C3%A1gina_principal.
research output, should be considered to be public goods and made available under the international definitions of OER\(^2\). Adherence to this principle requires attention to Intellectual Property Rights law and institutional regimes, price, access, and training.

2. **Transparency and collection data:** Data, statistics, and metrics regarding the success of the OER policy should be easily available to all.

3. **Training the trainers to collaborate:** Public funds for ICT investment in infrastructure should be conditioned on the recipient having an acceptable pedagogy plan to educate teachers and other key stakeholders in regard to open educational resources and the collaborative characteristic of the Information Society and the Internet plan. A pedagogy plan defines the inputs of open resources, the outputs of the educational process, and explains how teachers and the community will be engaged to take full advantage of the combination of technology and open content.

Under these general principles, we make a set of more detailed recommendations for next steps to realize the full potential of the network to positively transform the Brazilian educational system. These recommendations should be the starting point – not the end – for conversation, refinement, and implementation. Wherever possible, the recommendations are tied to the adoption of accepted existing or emerging international standards related to content and network–based innovation.

The unifying concept behind these recommendations is that policymakers should carefully consider the culture of the collaborative project on the network. Before the network, the impact of choices related to the interaction of technology, pedagogy, price, access, and intellectual property might have been small compared to the importance of classical infrastructure like the construction of buildings for libraries. But now, all of these factors must be considered as core elements of the social infrastructure of the community of educational stakeholders, and key to the long–term success or failure of educational technology investments.

The recommendations are as follows:

**I. Recommendation on the intersection of Content and Intellectual Property Rights:**

*Without clear exceptions and limitations for educational purposes and a uniform governmental policy managing the intellectual property rights that affect the educational resources paid by the diversity of governmental entities, the Brazilian society will face great legal insecurity when accessing and trying to use educational resources. Public money will be not efficiently spent, projects will not legally interoperate due to the myriad of intellectual property owners and licenses, and the goals of education democratization and inclusion will not be fully realized. Thus, we recommend:*

1) **Reform of Copyright Law:** Amend copyright law to expand and formalize exceptions and limitations related to education (such as private

---

\(^2\) “The open provision of educational resources, enabled by information and communication technologies, for consultation, use and adaptation by a community.” UNESCO, 2002.
copying), libraries (such as archive and preservation rights), and access to and use of resources for education without direct commercial gain;

2) **Taxpayer money and public access:** Establish a federal law/policy mandating “open” and cost–free licenses and, thus, access to books, theses and articles necessary for higher education when these are produced by professors working full–time in public universities; or students receiving full–time scholarships from the government; or when publications are the output of public–funded projects.

3) **Taxpayer money and public access:** Establish a federal law/policy mandating “open” and cost–free licenses and, thus, access to books and other educational resources, such as digital or analog learning objects, developed by and/or paid by the federal government, state governments, local governments and its sub–contractors;

4) **Better design to guarantee access:** Unify copyright policy, specifically through the establishment of a unified protocol and open licensing approach regarding projects, which aim to provide educational resources to all levels of education, when these are developed by and/or paid by the federal government, state governments, local governments and its sub–contractors.

II. Recommendation on the intersection of Content and Price

The lack of transparency in regard to market information of the real cost of educational materials generates an artificial market power to publishers in regard to the government and the society. Thus, we recommend:

1) **Market transparency:** Require publishers to disclose information on textbooks’ wholesale prices and revision histories;

2) **Market transparency:** Commission studies and reports to investigate high prices of textbooks and profit margins of companies operating with substantial revenues based on public purchase of textbooks.

III. Recommendation on the intersection of Content and Pedagogy policy

Analysis of the Brazilian education environment and the capabilities of absorption of ICTs, or even the level of media literacy, shows that Brazilian students lack the skills to be fully integrated into the knowledge society, contribute to it and access its benefits. Thus, a focus on better qualifications for our teachers is crucial, since this will have an increasing important role in providing guidance and assistance in the education process in the knowledge society. Thus, we recommend:

1) **Train the trainers:** Create online courses to train teachers in the use of online educational resources and media and TIC literacy;

2) **Train society:** Create specific pedagogical resources for the use of OER open, free and available to all;
3) **Incentives and metrics**: Create metrics to reward teachers who not only use OER but recontribute new OER, and use those metrics in the tenure and career promotion decisions;

IV. **Recommendation on the intersection of Content and Technology policy**

*Develop a standardized set of open protocols of legal and technical open standards required to make digital educational repositories interoperable. The policy must cover all forms of creative content, from e-theses to learning objects and courseware to software essential for digital education. Thus, we recommend:*

1) **Standardize thesis policies**: Develop a unified technology policy for access and re-use of Theses, spanning from data to software to creative works to know-how and rights to practice, connected to existing technology standards like the Open Archives Initiative, to develop a single meta-index of Brazilian e-Theses.

2) **Standardize courseware policies**: Develop a unified technology policy for access and re-use of Open University courseware, spanning from data to software to creative works to know-how and rights to practice, connected to existing technology standards like the Open Archives Initiative, to develop a single meta-index of Brazilian Open Courseware.

3) **Standardize software policy**: Develop a standard set of funding mandates for software development to result in Free / Libre Open Source Software.
I – Introduction

Enormous investments are being made worldwide to integrate the Internet into educational processes: broadband to connect schools, laptops distributed to teachers in very competitive prices, computer laboratories built in schools. However, the focus is nearly always on infrastructure. Statistics and metrics of the number of wired classrooms, the number of computers in schools - these are often the key elements of policy making and judgments of success.

When there is contemplation of how information moves across this infrastructure, the problem is usually characterized as a set of isolated challenges, and not into a cohesive view of how information is intertwined with technology for education. Thus, the One Laptop Per Child project is tied to its “Sugar” operating system and Creative Commons licenses, scholarly literature is tied to the Open Access movement, and Free Software is listed in guidebooks for consumption. This does not create the ideal foundation for educational innovation. These diverse elements of hardware, software, content, and applications all play a role in innovation on the network, and in the success or failure of creation of cultures of collaboration and reuse. They must come together to achieve the potential inherent in a networked educational culture.

Treating the elements as separate items rather than a connected educational ecosystem misses a key dimension of the discussion, which is how the infrastructure and content are used in education and how the culture of collaborative work can transform both teachers and learners. For this, it is essential to address the issues inherent in digital content. Content in this sense means everything from theses to software to modules to textbooks to research articles to videos and games; and content issues cover a wide variety of ground – from teacher training to intellectual property rights, content price, access privileges, technical standards, and more. Content in its wide, digital context is the foundation for modern education.

Education policy and projects that combine infrastructure investment with a coherent “network” approach to content are the most likely to have significant positive impact and realize the goals of the policy. The ability of the Internet to create radical increases in innovation is not an accident – but it is also not guaranteed to happen simply through putting computers and courses onto the network. This “generative” effect of networks comes from the combination of open technologies, software platforms that allow creative programming, the right to make creative and experimental re-use of content, and

---

3 The most recent program in Brazil – started in 2009 – is the Portable Computer for Teachers (Projeto Computador Portátil para Professores), a program from the federal government which aims to give access to laptops at a cost of R$ 1000,00 (less than US$ 500.00) http://www.computadorparaprofessores.gov.br/ and now available to professors from all Brazilian cities.

4 “The generative capacity for unrelated and unaccredited audiences to build and distribute code and content through the Internet to its tens of millions of attached personal computers has ignited growth and innovation in information technology and has facilitated new creative endeavors…” THE GENERATIVE INTERNET by Jonathan L. Zittrain 119 Harv. L. Rev. 1974 (2006), http://www.harvardlawreview.org/issues/119/may06/zittrain.shtml
the widespread democratization of the skills and tools required to exercise all of those rights.

As nations worldwide move to implement digital education projects, and developing nations in particular look to use the Internet to replace outdated and insufficient educational systems, an examination of existing work is in order. It is important to provide a map of lessons learned, and to understand how existing Brazilian projects can be connected to one another to create the largest possible impact for both educators and learners. Our goal is examine these broad issues within the lens of a detailed examination of the Brazilian experience applying ICTs to education in policy, technology, pedagogy, and the impact of the emerging concept of “open educational resources” in both theory and practice.

II - Purpose

Brazil is poised at a decisive moment to improve education. With a record total budget of more than R$ 4,000,000,000 of Reais in the hands of the Ministry of Education as of 2009, a major effort to connect the public network of schools to the Internet and to foster the adoption of digital educational tools, in addition to an increased investment in access to and research in higher education, is taking place.

With this Green Paper, the Brazilian Open Educational Resources Project aims to join the ongoing debate on the long-term future of open educational resources - both projects and policy - in developing countries, with a primary focus on Brazil. In particular, the Green Paper is an attempt to structure the open educational resources debate as it relates to access to publicly funded educational resources. There are four axes of structure to the OER context in Brazil, echoing internal structures of traditional education as well as the new opportunities afforded by the move to digital networks for dissemination and use of educational materials:

• public access to educational materials in general, as an open education strategy to include the individual, the family, the community and the whole society in the process of learning and of collaborative knowledge production;

• the economic cycle of educational materials production and its impact on the “right of citizens to learn”; 

• the possible benefits OER may bring to learning strategies, the production of educational resources more sensitive to issues driven regional diversity and regional standards of quality;

5 As we review this paper, the Brazilian Educational Ministry announced the 2010 budget, which will increase more that R$ 7,000,000,000, reaching more that 10 billions in 2011 due to the “Emenda 59”. http://portal.mec.gov.br/index.php?option=com_content&view=article&id=14854.
• the impact of digital, online, open resources on teachers’ continuous professional development.

To draw the projects along these axes of structure, this Green Paper creates a map of Open Educational Resources efforts in Brazil, understanding the role OERs play in the educational context and if they are developed under a consistent educational policy. Questions of how educational policy is favorable (or not) to OER, and how public funding flows into educational materials such as textbooks are discussed.

This consultation is targeted at everyone – education experts, policy makers, teachers, and self-learners – who wants to advance access to knowledge, open education and educational levels by using the collaborative, innovative and more inclusive approach presented by open education resources. It aims to be an open dialogue, a start point. Wide dissemination of education contributes to more inclusive and cohesive societies, fosters equal opportunities and innovation in line with the priorities of a renewed social agenda focused on the knowledge society. In this sense, this study brings a series of recommendations to foster this dialogue and present the foreseen benefits of Open Educational Resources.

The paper begins with a set of recommendations and a brief introduction of how the concept of Open Educational Resources interacts with the concept of development. The second section explores the state of education in Brazil - its policy governance, structures and institutions. The third section delivers an analysis of Brazilian “open” educational projects against the international definitions of the concept of Open Educational Resources as understood by UNESCO and the Cape Town Open Education Declaration. The fourth section examines the state of textbooks in Brazil, analyzing public policies, government purchase programs, and the impact of intellectual property law and institutional regimes in the access to textbooks, which have key leverage in making choices about educational resources. The fourth section also examines the challenges for textbooks specifically within the Brazilian equivalent to the K-12 education and college, with particular attention to the flow of public investments into the production and distribution of textbooks. The fifth part brings an overview of more than 10 projects that are reminiscent of Open Educational Resources, but which have work left to become true OERs, and the sixth and part is the conclusion of this Green Paper.
III - Recommendations:

The recommendations we set come from a deep analysis of the structure, market and policies molding education in Brazil, which follows in this paper. Additionally, some of the recommendations are built after a deep analysis of current projects – lead by the government and by private parties – to provide educational resources to a broader group of individuals. In this sense, we scrutinized 11 Brazilian projects that have in their mission to provide educational resources in an “open and more inclusive” fashion.

The conclusions we build call the attention for the lack of a long-term design and lack of uniformity and interoperability of resources, what generates insecurity in regard to their use and also a probable inefficient use of public resources in some cases. Additionally, we developed a case study on the problematic issue of access to textbooks in Brazil⁶. Also, we explain the role of copyright within the educational resources sector and how it affects access to knowledge, and recommendations are also drawn from this analysis.

We established three pillars regarding the intersection of ICT and educational policy, assuming that the highest return on public investment in education ensues when the following principles related to the interaction of contents and networks are reality:

1. **Public access to publicly funded educational materials:** Publicly funded educational materials, both the teaching materials and the research output, should be considered to be public goods and made available under the international definitions of OER⁷. Adherence to this principle requires attention to Intellectual Property Rights law and institutional regimes, price, access, and training.

2. **Transparency and collection data:** Data, statistics, and metrics regarding the success of the OER policy should be easily available to all.

3. **Training the trainers to collaborate:** Public funds for ICT investment in infrastructure should be conditioned on the recipient having an acceptable pedagogy plan to educate teachers and other key stakeholders in regard to open educational resources and the collaborative characteristic of the Information Society and the Internet plan. A pedagogy plan defines the inputs of open resources, the outputs of the educational process, and explains how teachers and the community will be engaged to take full advantage of the combination of technology and open content.

⁶ In regard to matter of price of and access to textbooks in Brazil, we also recommend the review and reports developed by the Research Center for Access to Information and Public Policy - GPOPAL at University of Sao Paulo, at http://www.gpopai.usp.br/wiki/index.php/P%C3%A1gina_principal.

⁷ “The open provision of educational resources, enabled by information and communication technologies, for consultation, use and adaptation by a community.” UNESCO, 2002.
Under these general principles, we make a set of more detailed recommendations for next steps to realize the full potential of the network to positively transform the Brazilian educational system. These recommendations should be the starting point – not the end – for conversation, refinement, and implementation. Wherever possible, the recommendations are tied to the adoption of accepted existing or emerging international standards related to content and network-based innovation.

The unifying concept behind these recommendations is that policymakers should carefully consider the culture of the collaborative project on the network. Before the network, the impact of choices related to the interaction of technology, pedagogy, price, access, and intellectual property might have been small compared to the importance of classical infrastructure like the construction of buildings for libraries. But now, all of these factors must be considered as core elements of the social infrastructure of the community of educational stakeholders, and key to the long-term success or failure of educational technology investments.

The recommendations are as follows:

I. Recommendation on the intersection of Content and Intellectual Property Rights:

Without clear exceptions and limitations for educational purposes and a uniform governmental policy managing the intellectual property rights that affect the educational resources paid by the diversity of governmental entities, the Brazilian society will face great legal insecurity when accessing and trying to use educational resources. Public money will be not efficiently spent, projects will not legally interoperate due to the myriad of intellectual property owners and licenses, and the goals of education democratization and inclusion will not be fully realized. Thus, we recommend:

1) Reform of Copyright Law: Amend copyright law to expand and formalize exceptions and limitations related to education (such as private copying), libraries (such as archive and preservation rights), and access to and use of resources for education without direct commercial gain;

2) Taxpayer money and public access: Establish a federal law/policy mandating “open” and cost-free licenses and, thus, access to books, theses and articles necessary for higher-education when these are produced by professors working full-time in public universities; or students receiving full-time scholarships from the government; or when publications are the output of public-funded projects.

3) Taxpayer money and public access: Establish a federal law/policy mandating “open” and cost-free licenses and, thus, access to books and other educational resources, such as digital or analog learning objects,
developed by and/or paid by the federal government, state governments, local governments and its sub-contractors;

4) Better design to guarantee access: Unify copyright policy, specifically through the establishment of a unified protocol and open licensing approach regarding projects, which aim to provide educational resources to all levels of education, when these are developed by and/or paid by the federal government, state governments, local governments and its sub-contractors

II. Recommendation on the intersection of Content and Price

The lack of transparency in regard to market information of the real cost of educational materials generates an artificial market power to publishers in regard to the government and the society. Thus, we recommend:

1) Market transparency: Require publishers to disclose information on textbooks’ wholesale prices and revision histories;

2) Market transparency: Commission studies and reports to investigate high prices of textbooks and profit margins of companies operating with substantial revenues based on public purchase of textbooks.

III. Recommendation on the intersection of Content and Pedagogy policy

Analysis of the Brazilian education environment and the capabilities of absorption of ICTs, or even the level of media literacy, shows that Brazilian students lack the skills to be fully integrated into the knowledge society, contribute to it and access its benefits. Thus, a focus on better qualifications for our teachers is crucial, since this will have an increasing important role in providing guidance and assistance in the education process in the knowledge society. Thus, we recommend:

1) Train the trainers: Create online courses to train teachers in the use of online educational resources and media and TIC literacy;

2) Train society: Create specific pedagogical resources for the use of OER open, free and available to all;

3) Incentives and metrics: Create metrics to reward teachers who not only use OER but recontribute new OER, and use those metrics in the tenure and career promotion decisions;

IV. Recommendation on the intersection of Content and Technology policy
Develop a standardized set of open protocols of legal and technical open standards required to make digital educational repositories interoperable. The policy must cover all forms of creative content, from e-theses to learning objects and courseware to software essential for digital education. Thus, we recommend:

4) **Standardize thesis policies**: Develop a unified technology policy for access and re-use of Theses, spanning from data to software to creative works to know-how and rights to practice, connected to existing technology standards like the Open Archives Initiative, to develop a single meta-index of Brazilian e-Theses.

5) **Standardize courseware policies**: Develop a unified technology policy for access and re-use of Open University courseware, spanning from data to software to creative works to know-how and rights to practice, connected to existing technology standards like the Open Archives Initiative, to develop a single meta-index of Brazilian Open Courseware.

6) **Standardize software policy**: Develop a standard set of funding mandates for software development to result in Free / Libre Open Source Software.
IV - Open Educational Resources Concepts

A significant attribute of most educational resources is that they are restricted to a set of traditional players with access through institutional employment or enrollment. As such, many educational materials face high access costs and, if free to access, copyright restrictions block creative re-use, restricting the actions of remix essential to modern pedagogical activity. This follows the economic market for educational resources, which is a typical content sales market. Educational materials are packaged as copyrighted goods that have to be bought from a store or accessed through course fees, repositories with restricted access, or directly from the manufacturer-publisher.

In basic to high-school levels of public schooling, free and temporary provision of educational material provided through governmental programs guarantees access for those attending public schools in many countries. However, problems regarding diversity, appropriateness, timeliness, and quality of these materials are common. Also, the provision of copyrighted educational material via public libraries has proven insufficient, since the number library of buildings (and their structural conditions), the number of copies available, photocopying restrictions, and the opportunity costs involved in traveling to the library often represent great barriers to learners.

This situation is even more severe in developing countries such as Brazil, where, among other problems, teachers frequently need more and better training, resources are often scarce or non-existent, public library buildings are falling apart, and cost of textbooks are prohibitive for many college students and their families.

The philosophy of open educational resources (OERs) places educational materials as common and public goods from which all should benefit, but most especially those who receive the least benefit and support from current systems of education, whether publicly or privately funded. This view is supported by the notion that sees knowledge itself as a collective social product that naturally forms a commons.

Many variations of the OER concept have been proposed over the years within the broader open education community. For instance, the OECD 2007 report Giving Knowledge for Free (OECD Report) suggests that the term “open educational resources” refers to accumulated digital assets which can be adjusted and provide benefits without restricting the possibilities for others to enjoy them. Another OER leader, David Wiley, described in 2000 open educational content and resources as digital learning objects, such as “small (relative to the size of an entire course) instructional components that can

---

8 in general the student can use the book just for the scholarly year, having to give back the book to the school at the end of each term
9 In this sense, when the consumption of the educational resource by one individual does not reduce availability of that resource for consumption by others; and that no one can be effectively excluded from using the resource.
10 [http://mitpress.mit.edu/catalog/item/default.asp?type=2&tid=11309 Opening Up Education], pg 149
be reused a number of times in different learning contexts . . . [that are] deliverable over the Internet . . . [and that] any number of people can access and use them simultaneously (as opposed to traditional instructional media, such as an overhead or videotape, which can only exist in one place at a time)“.

Digital library world members view open content for education as being anything used for educational purposes, usually with access free as in “free of cost” that someone has posted to a managed collection of learning materials and resources. Finally, some also add open pedagogical content as part of OERs, affirming that the OER movement can only reach its potential when teachers participate in the development of open educational content by contributing their pedagogical expertise in development and use of these materials, by documenting the learning routine and process developed within specific groups of students. In this sense, Flora MacMartin considers that “OER are resources with context, with purpose, with pedagogical frameworks. They are not stand-alone pieces of information.”

In 2002, during the Forum on the Impact of Open Courseware for Higher Education in Developing Countries, UNESCO defined as OERs as “The open provision of educational resources, enabled by information and communication technologies, for consultation, use and adaptation by a community of users for non-commercial purposes.” However, UNESCO and the early leaders of the movement dropped the “for non-commercial purposes” part of the definition, acknowledging its restrictive nature. Non-commercial licenses bring, by their nature, significant risk to the “interoperability” of content collections and also a great level of insecurity due to the lack of agreement in regard to the juridical meaning of the “non-commercial” clause. Legal interoperability is an essential factor in the ability to scale a broad network of educational content, and the non-commercial clauses in licensing can hinder the emergence of the desired community of users and uses, frequently chilling even uses desired by the content owners by default. This still is a contentious discussion within the OER movement, mirroring discussions in the Free-Libre Open-Source Software movement (non-commercial licenses fail both the Free Software Definition and the Open Source Definition) as well as the Open Access movement of access to scholarly literature on the Internet.

The definition we adopt for the purposes of this Green Paper is widely used and is the most broad in scope, as our goal here is to cast a wide lens on a variety of projects in Brazil. Crafted by The William and Flora Hewlett Foundation, it states that OER are teaching, learning and research resources that reside in the public domain or have been released under an intellectual property license that permits their free use or re-purposing.

---

13 In September, 2009, the organization Creative Commons published the report “Defining Noncommercial”. http://creativecommons.org/weblog/entry/17127
by others. In this sense, OER includes learning content, software tools to develop, use and distribute any kind of content, and implementation resources such as open licenses. From the Cape Town Open Education Declaration: “These resources include openly licensed course materials, lesson plans, textbooks, games, software and other materials that support teaching and learning. They contribute to making education more accessible, especially where money for learning materials is scarce. They also nourish the kind of participatory culture of learning, creating, sharing and cooperation that rapidly changing knowledge societies need.”

This holistic understanding of the OER concept is essential to help us understand if projects developed under the “open” flag, such as the Brazilian projects analyzed in this Green Paper, successfully achieve true openness – and if not, what pieces of the puzzle are missing.

The OECD Report goes a step further in the discussion of OER and invites a rethink of the action of “going to school” and “formal education”, pointing three arguments for governments to support OER projects:

- They expand access to learning for everyone but most of all for nontraditional groups of students and thus widen participation in higher education.
- They can be an efficient way of promoting lifelong learning for both the individual and the government.
- They can bridge the gap between non-formal, informal and formal learning.

In this sense, OER is a fundamental instrument to instantiate an Open Education framework, and draws upon “open technologies that facilitate collaborative, flexible learning and the open sharing of teaching practices that empower educators to benefit from the best ideas of their colleagues. It may also grow to include new approaches to assessment, accreditation and collaborative learning.”

The OER philosophy finds fertile ground to bloom on the Internet, where the expansion of digital technologies ruptures pre-network barriers of space, time and money, allowing socially beneficial consequences such as new forms of knowledge production and distribution to emerge. Scholars see evidence of this commons formation in free software, access to scholarly literature, “free culture” and other areas in which the network has both disrupted traditional “read only” culture and enabled the emergence of an empowered individual creator existing within a community of creators.

A key and widely known element of these communities is that the cost of copying and

---

15 Cape Town Open Education Declaration
distributing new content drops to nearly zero after its production. In the education context, this change allows for the debate to shift on educational resources, at least in regard to those that are often publicly funded: once the society has paid for the creation of resources through taxes, how should they be managed and made available?

In this sense, OER is a reaction to the move of proprietary analog educational materials management onto the network. OER encourages and enables the open production, sharing of, and access to educational content and resources. This alone is a valuable societal good, increasing the value of investments made in education. But OER creates the opportunity for a more fundamental and transformative change: the move from passive consumption of educational resources to the formal engagement of educators and learners in the creative process of education content development itself.

The Cape Town Open Education Declaration, a community definition of OER, is clear on fostering both advantages of the philosophy. Cape Town notes that “Educators worldwide are developing a vast pool of educational resources on the Internet, open and free for all to use. These educators are creating a world where each and every person on earth can access and contribute to the sum of all human knowledge. They are also planting the seeds of a new pedagogy where educators and learners create, shape and evolve knowledge together, deepening their skills and understanding as they go.”

The reasons and motivations for the materialization of the OER phenomenon are many. Siemens (2003) lists a number of reasons for educators to share learning resources for free, including: sharing digital resources has essentially a zero cost for dissemination; giving educators alternatives and increasing competition in the market; and democratizing and preserving public education.

For instance, the OECD Report asserts that the reasons for individuals and institutions to use, produce and share OER can be divided into basic technological, economic, social and legal drivers. The technological and economic drivers include improved, less costly and more user-friendly information technology infrastructure (such as broadband), hardware and software. Content is cheaper and easier to produce and costs can be further reduced by sharing and re-use. The OER also spurs innovation in new economic models around the distribution of free content. Legal drivers are new licensing schemes that facilitate free sharing and reuse of content, and social drivers include an increased willingness to share.

However the OECD Report also recognizes that a key technical barrier is the lack of widespread broadband availability, part of what we generally call the “digital divide.” Lack of resources to invest in hardware and software for developing and sharing OER is an economic barrier. Barriers such as these are often mentioned as significant obstacles in developing countries. In addition, social barriers include a lack of skills to use the technical innovations (such as novel modern programming languages or APIs to platforms such as Facebook) and cultural obstacles against sharing or using resources developed by other teachers or institutions.
To these, the language barrier should be added as an enormous socio-cultural barrier, since the vast majority of OER is in English and based on Western culture, limiting relevance outside Western culture. This further carries the risk of consigning developing countries to be placed in the role of consumers. This reality has lead to efforts of open translation. However, these efforts still do not deal with the fact that: “Much of the educational materials available on the Web replicate the epistemological hegemony of higher education and the relationship between ‘developed’ and ‘developing’ nations, where knowledge (content) from the ‘developed’ is privileged over the ‘developing’.”

A literature review points to at least six types of reasons for an institution, such as a University or a School, to be involved in OER projects:

- The altruistic argument that sharing knowledge is in line with academic traditions and a good thing to do;
- Educational institutions (particularly those publicly financed) should leverage taxpayers’ money by allowing free sharing and reuse of resources.
- Quality can be improved and the cost of content development reduced by sharing and reusing.
- It is good for the institution’s public relations to have an OER project as a showcase for attracting new students.
- There is a need to look for new cost recovery models as institutions experience growing competition.
- Open sharing will speed up the development of new learning resources, stimulate internal improvement, innovation and reuse and help the institution to keep good records of materials and their internal and external use.
- The risk associated with “doing nothing” in a rapidly changing environment.

For individuals, some recognized incentives, familiar to the free-software and free-culture phenomenon, are:

- The altruistic motivation of sharing (as for institutions), which is supported by traditional academic values.

- Personal non-monetary gain, such as publicity, and reputation within the open community.

- Free sharing can be good for economic or commercial reasons, as a way of getting publicity, reaching the market more quickly, gaining the first-mover advantage, etc.

- Sometimes it is not worth the effort to keep the resource closed. If it can be of value to other people one might just as well share it for free.

Some of the recognized obstacles to the expansion of OER and its adoption, in addition to some of the barriers pointed above, refer to matters of trust in and quality of the content. Different from web culture, where the end-user is viewed as the arbiter of quality and value work in and review by “user-peers” is the rule - the peak of which perhaps being the manner in which Google aggregates the “choice” of the end users in where to link and click as the ultimate ranking systems of the web - in the education arena this is rarely the case. Recognized (or recognizable) expertise, academic skills and institutional support are crucial for the success of an OER. Many formulas are emerging to deal with these questions based on community driven content review. For instance, Connexions\textsuperscript{17} works with mechanisms such as branding, the possibility of specific look-and-feel for institutions and also the lenses\textsuperscript{18} mechanism, which brings a lists of content selected by an organization or individual.

Even with no clear statistical analysis due to the multitude of efforts under the OER flag, the Giving Knowledge for Free report points to, in January of 2007, more than 3000 open courseware courses available from over 300 universities worldwide. For instance, in repositories such as MERLOT\textsuperscript{19}, Connexions, OpenLearn\textsuperscript{20} and others\textsuperscript{21}, there are hundreds of thousands of pieces of content or materials representing thousands of freely available learning hours accessed from all over the world\textsuperscript{22}. As of January 2010, 15770 reusable modules woven into 969 collections are reported just in Connexions, while MERLOT reported 21684 materials.

V - Open Educational Resources and Open Access

Open Access is not the focus of this Green Paper, however, it is important to address it in relation to OER. As noted elsewhere in this Green Paper, OER does not exist as a movement in isolation. Free Software and Free Culture are in many ways siblings. But the closest relative is the Open Access movement calling for access to the fruits of scholarly publishing to be available on the internet. The tie to education is obvious and the movements share many actors and stakeholders. However, even acknowledging their proximity, these two social movements present different meanings and, in some extent, a different set of justifications and incentives.

As argued before, the Internet has a great impact on scientific communication and research; specifically, information and communication technologies (ICTs) have affected the publishing sector and given rise to new models of knowledge distribution in science. Open Access is the best method to maximize the flow, interchange and production of scientific knowledge – reminding us that access to knowledge is crucial for innovation and innovation is crucial for development.

Open Access (OA) is part of this greater revolution in knowledge generation and distribution allowed by the ICT expansion and has the potential to empower individuals, communities and institutions, contributing to development and wealth in the patterns proposed by the Information Society. In this sense, Open Access is an appropriate model for knowledge transfer, since:

Basic scientific research fuels most of our nation — and the world's — progress in science. Society uses the fruits of such research to expand the world's base of knowledge and applies that knowledge in myriad ways to create new wealth and to enhance the public welfare. Yet few people understand how scientific advances have made possible the ongoing improvements that are basic to the daily lives of everyone. Fewer still are aware of what it takes to achieve advances in science, or know that the scientific enterprise is becoming increasingly international in character. Freedom of inquiry, the full and open availability of scientific data on an international basis, and the open publication of results are cornerstones of basic research (...) By sharing and exchanging data with the international community and by openly publishing the results of research, all countries (...) have benefited. (Rossini, 2008)

Open Access is a knowledge distribution model through which scholarly, peer-reviewed

---

journal articles are made freely and openly over the Internet. In the era of print, open access was economically and physically impossible. Indeed, the lack of physical access and the lack of knowledge access were the same – without physical access to a well-stocked library, knowledge access was impossible. ICTs change that. Physical access to the ICTs is much easier than access to a library with all journals subscribed, but legal knowledge access is still very restricted. OA changes that in turn, as ICTs changed physical access.

The key definition of Open Access comes from the Budapest Open Access Initiative:

> By ‘open access’ to [the] literature, we mean its free availability on the public internet, permitting any users to read, download, copy, distribute, print, search, or link to the full texts of these articles, crawl them for indexing, pass them as data to software, or use them for any other lawful purpose, without financial, legal, or technical barriers other than those inseparable from gaining access to the internet itself. The only constraint on reproduction and distribution, and the only role for copyright in this domain, should be to give authors control over the integrity of their work and the right to be properly acknowledged and cited. (BOAI, 2001)

In Open Access the old tradition – to publish for the sake of inquiry, knowledge distribution, and peer acclaim – and a new technology – the Internet – have converged to make possible an unprecedented public good: “the world-wide electronic distribution of the peer-reviewed journal literature”

Brazil is a leader within the Open Access movement. Efforts lead by the Ministry of Science and Technology and by the Scientific Electronic Library Online (Scielo), an institution related to BIREME and the World Health Organization, working with Federal and State public Universities, are worldwide examples.

Specifically, in 2005, Brazil opened its doors to an important international symposium – the International Seminar on Open Access, a parallel event to the 9º Mundial Congress on Information in Health and Libraries and the 7º Regional Congress on Information in Health Science – where the Salvador Declaration was born. The Salvador Declaration was the first major statement on Open Access specific to the developing world.

Also, despite the lack of specific legislation mandating OA – and the presence of a new innovation law based on the U.S.A. Bayh-Dole Act (which creates economic incentives that prioritize confidentiality in order to prosecute patents by public universities) and

---

24 “The Budapest Open Access Initiative arises from a small but lively meeting convened in Budapest by the Open Society Institute (OSI) on December 1-2, 2001. The purpose of the meeting was to accelerate progress in the international effort to make research articles in all academic fields freely available on the internet. The participants represented many points of view, many academic disciplines, and many nations, and had experience with many of the ongoing initiatives that make up the open access movement.”

http://www.soros.org/openaccess

increasingly restrictive copyright legislation – government bodies and foundations are driving major projects forward in Open Access.\textsuperscript{26}

IBICT (Brazilian Institute on Science and Technology Information) hosts, under the Open Access and Scholarly Information Brazilian System (OASIS), the Digital Library of Thesis and Dissertations (BDTD) – a national digital library for electronic theses and dissertations from the Brazilian federal and state universities. The BDTD is already integrated in the international Networked Digital Library of Thesis and Dissertation (NDLTD)\textsuperscript{27}. The project has been a collaborative effort among IBICT, universities and other research centers in Brazil, with an architecture based on the Open Archives Initiative (OAI), where universities and research centers act as content providers and IBICT as a service provider. Brazil was one of the first countries to have a clear mandate for publication on the Internet of theses and dissertations\textsuperscript{28}. In service of this effort, a Brazilian metadata standard for electronic theses and dissertations was developed for the BDTD and a toolkit including open source package is being also distributed. We can see here the key elements of a knowledge commons for theses here: combination of digital library resource, policy mandate, and metadata interoperability standards.

The effort towards openness and a more inclusive educational system does not stop here. Open Access addresses materials that are more suited for graduate and post-graduate levels of education, and these are highly important, but not the only materials nor the only educational levels to which we should pay attention. In a country like Brazil, with high levels of illiteracy, and low numbers of the population in graduate and post-graduate levels, there is a great need to focus on a broader group of materials that support a more democratic and inclusive learning since the earliest ages.

\textsuperscript{26} Brazilian Institute for Information and Science (Ibict) and the State of São Paulo Science Foundation (FAPESP) joined with BIREME, are leading initiatives that are already consider global success models, such as the more than 10 years-old Scientific Electronic Library Online - Scielo (Gold Road) and OASIS (Green Road).

\textsuperscript{27} http://www.ndltd.org/

\textsuperscript{28} However, until the present, none of the Brazilian Public Universities has instituted an Open Access policy in regard to scientific papers\textsuperscript{28}. 
VI - The Education Reality in Brazilian lands…

VI.1. - Recognizing education as a necessary step for innovation

With the transition from the industrial economy of the 20th century to the knowledge economy of the 21st century, the global marketplace increasingly has rewarded flexible, efficient economies that are able to rapidly adapt to new circumstances—in a word, those that can “innovate.” Countries that have been successful most recently are those that have mechanisms in place for expanding trade, producing knowledge, and putting technology to efficient use. Increasingly, these countries participate in the global chain through economic conversion toward higher value-added activities.29 (Rodriguez et al., 2008, 88)

Recognizing this environment, and with UNESCO’s support, the Brazilian Minister of Science and Technology (MCT) elaborated, in 2001, the “Project of Strategic Directives for Science, Technology and Innovation in a 10-year horizon” (DECTI)30. The main objective of this project was the creation of the institutional basis the MCT would need to establish policies, guidelines and strategies for the development of science, technology and innovation in Brazil. It is also worth noting the 2007-2010 Action Plan (PAC)31.

30 The DECTI had its implementation started in 2001 and has five main points30:
  • “In the path of the Future”: focused in education to science and technology and the advancement of knowledge;
  • “Quality of Life”: focused the impact of scientific and technological development on the citizens and on the environment, with views to promotion of sustainable development;
  • “Economic development”: focused on Science and Technology from the economic angle - producing goods and services in a society marked by serious regional and social inequalities;
  • “Strategic Challenges” - focused on major programs of impact for the next decade, such as the information society and biotechnology, in projects mobilizing national and strategies of economic exploitation of the Brazilian borders, and
  • “Institutional Challenges” - focused on the legal, institutional and organizational challenges to be overcome.
31 One of the PAC’s objectives is amplify the innovation capacity in companies, but, for the purposes of the paper, what most matter is its objectives concerning31 the expansion, integration, consolidation and modernization of the National System of Science and Technology and Innovation (SNCTI), acting in conjunction with state governments to enlarge the national scientific and technological base, focusing on (i) Training of Human Resources for C,T&I and (b) Infrastructure and Promotion of Scientific and Technological Research; among other objectives.
The current Brazilian national innovation system is complex and intricate, and like all innovation systems is constantly in flux from new policies, new entrepreneurial developments, and international trade. But the Brazilian system has always prioritized a focus on knowledge creation and an investment in high-knowledge areas such as biotechnology and software.

All the policies above mentioned point to activities and strategies that seek to internalize and foster the production of knowledge in Brazil, and, simultaneously, put this knowledge at the service of social inclusion, capacity building and training, and of improvement of quality of life throughout the Brazilian territory. This clearly asks for programs that foster formal and informal access to knowledge and diversified education strategies.

However, it is highly questionable if the Brazilian education system is prepared to support this challenge. Studies and numbers in fact show the opposite – that the Brazilian private and public systems are not graduating the necessary working force to handle this responsibility regarding the future of the country. It does not recognize or facilitate long-life learning initiatives, leaving in the hands of the companies the training of a workforce that often arrives in the job with low levels of qualification and skill-deficits that should have been addressed by the education system.

VI.2. - The state of education in Brazil

Education in Brazil has changed significantly for the better in the last several years. However, there are serious problems related to quality, equity, inappropriate use of or lack of resources and under-trained teachers as found by a 2009 national exam performed by the Ministry of Education. One of the outcomes of this reality is that – even with nearly universal access to basic education, expansion of the secondary and higher education – 11.5% of children between eight and nine years old and 10% of adults (this index increases up to 23% in the Northeast) are illiterate.

One of the main achievements in recent years is related to school access and equity. However, many developing countries have made similar efforts, and in comparison to such countries, Brazil is not succeeding. Also, many criticize the fact that the Brazilian education system, which on paper seems to be exemplary, is, in reality neither able to teach rote knowledge nor critical thinking. As summarized by Simon Schwartzman, a visiting fellow at the Centre for Brazilian Studies at Oxford University, the main

34 We will discuss the Brazilian national education programs in section XX.
35 By “rote” knowledge we understand a memorized form in the absence of meaning.
problems are those related to quality and retention of students in the public system.\textsuperscript{36} Schwartzman points out the historical cause of these problems:

From this historical background, we can try to understand why education in Brazil did not develop as in other countries. The short answer is that, by and large, Brazilian society did not have the elements that would lead its population to organize and develop its own educational institutions; and the Brazilian state, both at the national and regional levels, did not have the human and financial resources, nor the motivation to bring the population into a centralized and vertical educational system. More specifically, two crucial links between these two spheres were missing, a well-structured and organized teaching profession for basic education, and an academic profession for higher education, which could spread, implement, and foster de values of education. (Schwartzman, 2003, 18)

VI.3. – Brazilian basic educational system

Currently, Brazil’s basic educational system is divided into preschool, which is intended to cover the social development of children through age six; and the fundamental learning (ensino fundamental), which is an eight-year cycle (from 7 to 14 year olds). These years are divided into two stages (grades 1–4 and 5–8, respectively), with national testing conducted at the end of each stage and an increasingly diversified curriculum and instructional organization during the second half of the cycle. The third division is a three-year intermediate cycle (ensino médio), which consists of grades 9–11 and is intended for students aged 15–17. The National Education Law—LDB (Lei de Diretrizes Basicas)—describes ensino médio as the “final phase of basic education” to which all citizens are guaranteed access.

The Brazilian Federal Constitution (BFC) states “Education, which is the right of all and duty of the State and of the family, shall be promoted and fostered with the cooperation of society, with a view to the full development of the person, his preparation for the exercise of citizenship and his qualification for work.” This article of the Brazilian Constitution is understood as imposing a duty on the State to ensure mandatory and free elementary education, including the assurance of free offer to all who did not have access to education at the proper age, and progressive universalization of the free high-school education.\textsuperscript{37}

Crucial to the OER debate are also some indices from article 5 of the BFC\textsuperscript{38}, which guarantee certain rights of the citizens: (a) to be part of cultural life; (b) to benefit from technological and scientific advances; (c) the right to information and expression and (d)

\textsuperscript{36} Simon Schwartzman (version 3, 2003), The challenges of education in Brazil. Centre for Brazilian Studies at Oxford University. \url{www.schwartzman.org.br/simon/pdf/challenges.pdf}

\textsuperscript{37} BFC, Articles 205 to 208. \url{http://www.v-brazil.com/government/laws/titleVIII.html}

\textsuperscript{38} BFC, Article 5: \url{http://www.v-brazil.com/government/laws/titleII.html}
the social function of property. None of these demand formal education as the exclusive channel for obtaining the skills and capacities needed in order to live these rights within the Information Society.

Prior to the 1988 Constitution, all three levels of government (municipal, state, and federal) were involved in the financing and provision of all levels of education. The resulting uncoordinated coexistence of education systems has been criticized as one of the primary sources of inequity and inefficiency within Brazilian basic education. With the 1988 Constitution guidelines and the 1996 National Education Law (LDB), the country delineated administrative responsibilities determining that the municipal and state governments should share responsibility for financing and provision of grades 1–8 (7 to 14 years old), while state governments are primarily responsible for the provision of grades 9–11 (equivalent to US high school, with teens from 15 to 17).

The BFC also establishes minimum levels of investment of its resources on education from the federal government (18%) and from the state and local governments (25%). In the early 2000s, the National Fund for Basic Education (FUNDEF) was created, in parallel to the National Institute for Educational Research (INEP), as a fund for financing sub-national spending on primary and lower-secondary education, reducing regional differences and setting a floor for state and municipal expenditures on fundamental education.

In this period, public schools also saw the development of new curricular guidelines for basic and secondary education, and other programs to provide schools with managerial, pedagogic and material resources (including educational materials, food, and cash).

Comprehension of the reality of the Brazilian education system is crucial to understanding the spaces possible for OER. Despite of the clear benefits OER brings in terms of experimentation and learning as part of the collaboration culture foster by the Internet, OER also represent a simple increase in return on investment in education. Open systems represent a better use of funds and the better use, reuse and adaptation of resources to lower the knowledge imbalances among geographic regions in Brazil. The flexibility OER brings represents a real flexibility (achieved at a low transaction cost) of adaptation of resources for local and specific needs. In this sense, the same material can be created just once – and not once in every region or for every purpose – and endlessly localized, across economic and age spaces. Additionally, the openness will assure that

40 INEP (http://www.inep.gov.br/) is as an office for education statistics and evaluation, which became responsible for the reorganization of Brazil’s education statistics and the implementation of three large systems of education assessment: SAEB, the assessment system for basic education; ENEM, a national exam for students completing secondary education; and the national examinations for undergraduate programs, known as “Provão”.

29
even those outside the formal education system can access and use the resources. This further ensures that experiences in regard to the development and use of the resources can and will be shared among educators.

VI.4. - ICTs and education in Brazil

With the context of the “traditional” education system, we may turn to the modernization efforts attempted since the rise of the consumer Internet in the 1990s, when enormous amounts of money were invested in bringing ICTs into education. There is general consensus that ICTs are a powerful tool to improve the educational process for both the teacher and the student, and to create opportunities for both traditional students and the life-long learner. There is however not a statistically significant amount of data to support these assumptions, and indeed studies have shown that even in the most advanced schools in industrialized countries, ICTs are generally not yet considered central to the teaching and learning process. However, there is also a general consensus that both teachers and students feel ICT use greatly contributes to student motivation for learning\(^{41}\).

One reason that it is hard to delineate the real impact of ICTs in education is that most measures are related to more easily measured infrastructure elements such as the number of computers bought, learning centers constructed, and so forth\(^{42}\). However, it is vital to note that when we speak of ICTs in education, the point is not learning to use the computer but instead “using the computer to learn\(^{43}\).”

For ICTs to truly play a positive disruptive role, they must be utilized across the entire range of education, from textbooks to teachers to methodology to administrators to parents to learners. Non-disruptive uses are the rule, such as leveraging existing computer laboratories to learn how to run house budgets in traditional spreadsheets (even when few houses have computers). There is also significant risk of “lock-in” to existing dominant software systems like the Microsoft ecosystem, since Microsoft has programs of donation or sale of computer with competitive prices to schools in Brazil. The lack of experience in the potential downsides of network effects in proprietary systems has affected the negotiating power of many regions in this context.

The positive disruptive role of networks requires changes in the ways teachers of all subjects are trained, they way they teach, the way they are rewarded, and more. OER represents one potentially significant "killer application" of ICTs in education that can create the open pool of reusable content for the teacher to bring to the new value chain of education, a more cooperative one.

\(^{41}\) http://www.infodev.org/en/Publication.154.html

\(^{43}\) http://www.mydigitallife.info/2008/03/04/ict-in-education/
VI.4.a – Data

However, what we have seem is that the story of ICT and education in Brazil follows the international trends. Brazilian policy exhibits of a general belief in the power of technology to benefit education, followed by a systematic investment in infrastructure – but not a systematic investment in training, pedagogy, and production of native content to an ICT view of education.

It is true, though that infrastructure is necessary and for a country with large social disparities, Brazil has made significant gains in expanding internet access and mobile-phone usage in recent years. It is home to the largest population of internet users in Latin America and the seventh largest in the world. The country first connected to the internet in 1990 through a network based on Universities, and connectivity is now available in most areas through a variety of technologies, though some infrastructural limitations remain.

According to the International Telecommunication Union (ITU), Brazil had 68 million internet users as of December 2008, representing 35.2% of the population. A lack of infrastructure affects large segments of users, mainly in rural areas, and is the primary barrier to internet connectivity. Nevertheless, great improvements have been made in recent years as the government has initiated dozens of programs to connect the population to the internet, including investment in WiMax Networks and Digital Cities projects. Many of these projects employ broadband technology, which is accessible to a large number of users. The internet is used by people at various socio-economic levels, and the country's e-commerce, e-government, and online-banking services are among the most developed in the world. However, due to persistent poverty, internet access remains out of reach for large portions of the population.44

44 http://www.freedomhouse.org/template.cfm?page=384&key=205&parent=19&report=79
Specifically regarding the use of ICTs and access to internet in schools, 40,000 schools have computer labs and almost 20,000 have broadband connections. The governmental plan is to connect, by 2010, all urban schools in Brazil (~55,000), while the remaining public schools in rural area (~87,000) are to be connected by 2018. The fulfillment of such a policy is conditioned on the accomplishment of universal access obligations assigned to telecommunications companies in Brazil and provision of computers through programs lead by MeC.\(^5\)

Ritla’s 2007 study *Pencil, Eraser and Keyboard* (Lapis, Borracha e Teclado) also notes that the availability of Internet access in public spaces, such as school or hot spots of digital inclusion, reinforces the divide that is observed in the rates of access to Internet from private spaces, such as homes. The study calls for plans that prioritize the access for sectors excluded from Internet - democratization of access – rather than the reinforcement of the economic divide via Internet access points.\(^6\) The fear is that the wealthy will be able to use the networ ubiquitously but the poor only at school or other public spaces. However, it is important to recognize here that this pattern is probably

\(^{6}\) www.ritla.net/index.php?option=com_docman&task=doc_download&gid=83
partially explained by the broadband network reach provided by the telecom companies and also the high costs of other kinds of access, such as satellite for rural areas.

Ritla’s 2007 study, based on the PNAD data\(^\text{47}\), found that in 2005 Brazil had 3,200,000 teachers. More than half (54%) had used the Internet in the 3 months before the census was done. However, the internal divide is enormous when comparing internet use of professors of higher education (93%) with the rest of the sample (29.4%). Also, regional variances are high: while 65% of educators from the south and southeast used the Internet, just 35% used in the north and northeast. 48% of Brazilian educators have computers in their homes, while 37% have Internet connectivity. The three main reasons that educators use Internet are: activities related to education, communication and reading of news.

VI.5. - Policy Background: The state of educational policy in Brazil

The Brazilian National Education System was developed before the widespread availability of consumer internet. It is based on a mandate from the Constitution of 1988 and implemented through a set of laws, plans and regulations. It can be understood as a complex inter-federative regime based on cooperation among the federal government, the states and municipalities. Under this system, the education in Brazil is regulated by the Federal Government, through the Ministry of Education, which defines the guiding principles for the organization of educational programs. Local governments are responsible for establishing state and educational programs following the guidelines and using the funding supplied by the Federal Government.

This system of cooperation is governed, at the federal level, by the Basis and Directives Law, the National Plan of Education, a system of graduate and post-graduate education (federal universities and institutes), a fund that regulates educational investments, and a system of national evaluation. At the state and municipal levels a system of a myriad of pedagogical possibilities.

Under this system, the goal is to reduce social exclusion to avoid social inequality. To achieve this and with a budget equivalent to 4.7% of the Brazilian GDP (41,000,000,000 Reais - the biggest in the history of the Ministry\(^\text{48}\)), the Brazilian Ministry of Education proposes a set of development programs in different but integrated directions. For instance we see the *Education Development Plan* (Plano de Desenvolvimento da Educação)\(^\text{49}\) – which created the Basic Education Development Index (Ideb), a measure of the flow of students to higher levels of education and of their performances through the *Brazil Exam* (Prova Brasil), focused on Portuguese language and Mathematics – and the *All for Education Plan* (Plano de Metas Compromisso Todos pela Educação), which is established through a Decree\(^\text{50}\). The Decree created a social contract in which federal,

state and municipal governments to work in an alliance with families and communities to implement a series of guidelines to coordinate pedagogical, administrative and financial actions. It also created the Articulated Action Plan (Plano de Ações Articuladas - PAR), a set of multi-year actions planned with each municipality and focused on basic educational improvement.

Under these Plans the Ministry of Education also restructured and consolidated a group of national evaluation systems, into the National System of Basic Education Evaluation (Sistema Nacional de Avaliação da Educação Básica - Saeb) e do National Exam of the Intermediate Cycle (Exame Nacional do Ensino Médio - Enem). The Prova Brasil exam is deployed under the Saeb system.

The programs under the PDE also include: equipping schools with the necessary structure to use computers and internet connections; enhancing teacher education and training stressing the development of information technology skills; providing open and distance learning opportunities; and offering free and quality digital learning resources.

The National Program for Informatics in Education (Proinfo) plan for the next three years consists of supplying 138,405 public schools in Brazil with computer labs and broadband internet connection, and offering training on educational technology for K-12 teachers of all parts of the country. Proinfo is a result of a partnership among the federal government, states and cities to equip schools with computers. A variety of digital content is brought to schools with the new computers, such as educational videos, multimedia-learning objects, hypertexts, and open source software.

However, this movement was also followed by the project “Legal School” (a literal translation for Escola Legal)\(^51\) developed by the American Chamber of Commerce in Brazil, Microsoft and others. The teacher toolkit brings information on intellectual property and fosters the idea of respect and protection of intellectual property as the only way to learning and innovation, expanding on the idea that the use and reuse of content constitute “piracy”.\(^52\) The toolkit is in use by the Secretaries of Education in Sao Paulo and Goiás\(^53\) states. The resources developed under this initiative do not explore concepts and methodologies of free and open source software or open licensing, such as Creative Commons. There is no material counterbalancing this initiative and fostering a broad understanding about the rights of students and professors under the Constitution and the Brazilian Intellectual Property System, or explaining the meanings of the exceptions and limitations the law creates in addition to controls on copying.

Thus, while Brazil has developed enormous effort in bringing ICTs to schools, the results deployed in schools have not yet fostered cooperation, collaboration or a realization of the potential of Internet Culture. The resources, toolkits and trainings revolve around what cannot be done and what is crime, generating insecurity and a possible underuse of Internet.

\(^51\) http://www.projetoescolalegal.org.br/
\(^52\) http://www.projetoescolalegal.org.br/?page_id=125
\(^53\) http://www.projetoescolalegal.org.br/?page_id=112
VI.5.a. – PDE and the focus on the teacher

One of the priorities that emerged within the Articulated Action Plan was the necessity of a better training strategy for teachers of the public k-12 schools network. During the development of the Articulated Action Plans by the cities, it became clear that the Brazilian educational public system is served by a large number of primary and secondary teachers who have low levels of qualification. As a result, many initiatives – by the government, non-governmental organizations (NGOs) and private sector organizations – have been undertaken by a variety of state and private providers for in-service teacher development.

The Ministry of Education believes that teachers will change their practices as they build up confidence using technology and as they have easy and access to digital content. In addition to this expectation of improvement through experience, the Ministry of Education action plan includes a restructuring of the teachers’ career plan, higher salaries and additional training of 240,000 teachers by 2010. The hope is that equity of access to information instruction and technology in schools will help to overcome economic barriers to achievement. It will also help educators to reduce the barriers that prevent some students from developing their full potential.

In order to accomplish these outcomes, the National Plan of Teachers Training was organized by MeC in partnerships with states, municipalities and public universities (76 institutions in total, offering 331,607 spaces) to offer training to teachers that had not finished a certificate in education, and to teachers that give classes in areas outside their core educational training. In order to register in the program, the teachers need to update their curriculum vitae and register their data at the Freire Platform54. The Teachers Portal – which we analyze in a later section – is also part of this strategy.

V.6. - Legal Background: The right to learn and Copyright

Intellectual Property law and policy can dramatically affect the government’s ability to provide public goods ranging from health care to education. Brazil was an early adopter of the Bern Convention55 and of the TRIPS agreement, with its current copyright law in force since 199856. The Brazilian law n. 9610/98 regulates copyright and adopts the system of exceptions and limitations to grant rights to those who access knowledge. Recently Brazil partnered with other developing countries to lead discussions on a

54 http://freire.mec.gov.br/ssd/index/
55 Brazil adopted the Bern Convention from 1886 in 1922.
56 While this paper is been written, Brazil discusses a new bill of law, which will change law n. 9610/98. The discussions around the bill happened through the organization of regional and national forums, lead by the Ministry of Culture, where a great diversity of stakeholders could participate. The hope is that the bill will bring a broader set of exceptions and limitations to grant rights to those who access knowledge. The perspective is that the bill will enter the Congress in February 2010 for review and vote.
http://www.cultura.gov.br/site/categoria/politicas/direitos-autorais-politicas/
Development Agenda\textsuperscript{57} to bring balance to the international Intellectual Property system.

Currently, the main copyright statute (Lei 9.610/98), the 1940 Penal Code (recently altered in its copyright-related matter by Lei 10.695/03) and Software Law (Lei 9.609/98) form the system that regulates copyright in Brazil.

\textbf{VI.6.a. - Copyright}

Copyright gives the author of an original work exclusive right for a certain time period in relation to creative works that are generally characterized as artistic or literary, such as poetry, movies, video games, videos, plays, paintings, sheet music, books, recorded music performances, novels, software code, sculptures, photographs, choreography, and architectural designs, among others. Brazil recognizes both moral and patrimonial rights.

After continuous expansions of copyright terms (from 14, passing to 28, then 50 years) and adaptation to international standards, Brazil now protects copyright for 70 years starting in January 1\textsuperscript{st} of the subsequent year of the author’s death. Taking into consideration the average life of a Brazilian (68 years old), copyright protection lasts for up to of 150 years. Since Brazil recognizes moral rights; part of these rights – such as the right to attribution – lasts indefinitely.

\textbf{VI.6.a.1. - Exceptions and Limitation regarding education}

Exceptions and limitations refer to situations in which the exclusive rights granted to copyright holders under copyright law do not apply. Exceptions and limitations are widely recognized as an essential part of the balance between public and private interests inherent in copyright law and the systems surrounding it\textsuperscript{58}.

The law n. 9.610/98 incorporates the current rules of Brazilian copyright exceptions and

\textsuperscript{57}The WIPO Development Agenda is a strategic device that brings a development perspective to IP issues. However, the practical impact of the WIPO DA will not be felt in the short-term and it will take time to see whether the principles of the Agenda will be incorporated into the WIPO’s day-to-day actions. The first WIPO report on the Development Agenda chose recommendations for immediate adoption can be found here: http://www.wipo.int/ip-development/en/agenda/recommendations.html. Many months have passed since the adoption of the Development Agenda, in October 2007. It is time to start a critical appraisal of what is working, what is failing and what else should be done.

\textsuperscript{58}Such as the prevision 27(1) of the Universal Declaration of Human Right which guarantees the right of all to share in the cultural and scientific output of humanity by stating: “Everyone has the right freely to participate in the cultural life of the community, to enjoy the arts and to share in scientific advancement and its benefits.”. Yochai Benkler (2003) summarizes this conflict in this passage: “Copyright law is defined by constant tensions between exclusive private rights on the one hand and the freedom to read and express oneself as one wishes on the other hand. As a matter of economics, copyright represents a tension between the advantages of market-based production of information and cultural goods on the one hand, and the intrinsic limitations of property rights as institutional solutions to the public goods problem of information production on the other hand. As a matter of political morality, copyright supports democracy by grounding some types of expression in the market, independent of government patronage. But in doing so, copyright imposes substantial risks of harm to democracy and individual autonomy”. 66 Law & Contemp. Probs. 173 (Winter/Spring 2003)
limitations in its articles 46, 47 and 48. These norms may be divided into three groups: 1) derivative works, 2) partial or full reproduction, and 3) performing rights. However, no clear and general limitation concerning the use of works specifically for education (as developed, for instance, in countries such as the USA under the fair use doctrine) is

59 “Chapter IV - Limitations on Copyright
46. The following shall not constitute violation of copyright:
I. the reproduction
(a) in the daily or periodical press of news or informative articles, from newspapers or magazines, with a mention of the name of the author, if they are signed, and of the publication from which they have been taken;
(b) in newspapers or magazines of speeches given at public meetings of any kind;
(c) of portraits or other forms of representation of a likeness, produced on commission, where the reproduction is done by the owner of the commissioned subject matter and the person represented or his heirs have no objection to it;
(d) of literary, artistic or scientific works for the exclusive use of the visually handicapped, provided that the reproduction is done without gainful intent, either in Braille or by means of another process using a medium designed for such users;
II. the reproduction in one copy of short extracts from a work for the private use of the copier, provided that it is done by him and without gainful intent;
III. the quotation in books, newspapers, magazines or any other medium of communication of passages from a work for the purposes of study, criticism or debate, to the extent justified by the purpose, provided that the author is named and the source of the quotation is given;
IV. notes taken in the course of lessons given in teaching establishments by the persons for whom they are intended, provided that their complete or partial publication is prohibited without the express prior authorization of the person who gave the lessons;
V. the use of literary, artistic or scientific works, phonograms and radio and television broadcasts in commercial establishments for the sole purpose of demonstration to customers, provided that the said establishments market the materials or equipment that make such use possible;
VI. stage and musical performance, where carried out in the family circle or for exclusively teaching purposes in educational establishments, and where devoid of any profit-making purpose;
VII. the use of literary, artistic or scientific works as proof in judicial or administrative proceedings;
VIII. the reproduction in any work of short extracts from existing works, regardless of their nature, or of the whole work in the case of a work of three-dimensional art, on condition that the reproduction is not in itself the main subject matter of the new work and does not jeopardize the normal exploitation of the work reproduced or unjustifiably prejudice the author's legitimate interests.
47. Paraphrases and parodies shall be free where they are not actual reproductions of the original work and are not in any way derogatory to it.
48. Works permanently located in public places may be freely represented by painting, drawing, photography and audiovisual processes."
60 In the USA, the fair use doctrine is based on the First Amendment of the American Constitution authorizes the use of works for "Educational purposes", meaning:
· non-commercial instruction or curriculum based teaching by educators to students at nonprofit educational institutions
· planned non-commercial study or investigation directed toward making a contribution to a field of knowledge, or
· presentation of research findings at non-commercial peer conferences, workshops or seminars.
It is vital to realize that fair use in the USA is considered a defense, and not a “right” – one can argue fair use in response to an infringement lawsuit, but one is not guaranteed that the judge will agree that the doctrine applies. Indeed, some eminent legal scholars believe that fair use has become simply the “right to call a lawyer.”
Among these, there are two articles that relate to educational use. The first one, our major focus in this Green Paper, is the article that allows partial copies of works, while the second is the article that allows the reproduction of works for the visually impaired.

Another limitation under the Brazilian copyright law is the right of students to take lecture notes, though there is no corresponding right to publish them without the lecturer’s prior authorization.

Also, unlike the USA situation, the industry reached no agreement with academic institutions, nor did institutions publish any specific guidance until recently, in the context controversial case of copy of textbooks – which resulted from the US threat to insert Brazil back in its Special 301 black list. We will discuss this issue later in this section.

In regard to partial copies of works, the article 46 II reads:

“46. The following shall not constitute violation of copyright:
   (…) II. the reproduction in one copy of short extracts from a work for the private use of the copier, provided that it is done by him and without gainful intent;” (emphasis by author)

Additionally, in 2003, the Penal Code was amended to include a provision establishing that there is no crime when the act under considerations is covered by a limitation or exception under the Copyright law or if it consists in a “copy of an intellectual work or phonogram, in a single copy, for the private use of the copyist, without intent of direct or indirect profit.” Thus, under the amended penal code, it is not a crime to make a single copy of a work for private use of the copyist. However, this still is an infringement at the civil sphere, opening compensation and search and seizure rights to the copyright owner who sees a whole copy of her work taken. This situation generates great uncertainty within groups of teachers and students in regard to the access, use and copying of

The long-term US debate over course-packs and digital media also resulted in “educational use guidelines” established by publishers and parts of the academic community, and endorsed by the US Copyright Office. These guidelines are considered to be minimum standards for fair use in education, generating a zone of non-infringement. But is also true that they represent a very conservative interpretation of the law. Many of the initial proposals allowing a broader understating of fair use were never adopted, creating an ongoing debate about educational fair use. (Resources: http://copyfight.corante.com/archives/004834.html; www.copyright.gov/circs/circ21.pdf; http://fairuse.stanford.edu/Copyright_and_Fair_Use_Overview/chapter7/7-c.html; http://www.centerforsocialmedia.org/resources/publications/fair_use_in_online_video)

Specifically, the 2008 report stated: “Conduct effective enforcement against copyshops, located both inside and outside university campuses that make illegal copies of books and related teachers’ notes that go beyond the bounds of the law. Also, engage university administrations in efforts to encourage the use of legitimate materials on campuses.” and “Work with the State of São Paulo University to reverse its administrative rule, which allows widespread reprographic copying of portions of books by commercial, for-profit copy centers.” http://www.iipa.com/rbc/2008/2008SPEC301BRAZIL.pdf

resources for educational purposes, since the reach of this article has been fiercely debated over the past years, resulting in a slew of bills of law in all directions and extremes. The center of the debate concerns the meaning of “short extracts”, and the efficiency of having the student being the actual “copier” and not just a person gaining a copy from a third party. Also, much has been debated in terms of what qualifies as “gainful intent” as many of the copy-shops are part of university departments and price the copies based at cost.

Additionally, it is constantly noted in these discussion that the Brazilian government and society provides high direct and indirect incentives for the production of textbooks and books in Brazil. This creates an ongoing debate over the role of the government to exercise market power on behalf of society. Details on this follow.

VI.7. - The Textbooks Case

Although our study is not limited to textbooks, particularly when one considers how digital expressions of educational content have begun to blur the definition of a “textbook”, the prominence of this form of educational material (EM) acts as an important gateway to understand the rest of the EM field. The price of and access to quality textbooks, particularly at the higher education level, has been a highly controversial issue in many countries.

The following sections focus on professional and scientific textbooks and books – those in general used in higher education, and textbooks for the equivalent to the k-12 level in Brazil.

VI.7.a. - The Brazilian discussion around the copying of books

Since the law was developed without an eye for the reality, necessities and routines of college academic life and markets in a developing country, mass infringement is the rule. Copies of book chapters, scientific articles, and even entire books can be found in copy-shops around universities, ready for on-demand reproduction for the academic community. Spiral-bound photocopies of class materials and textbooks are carried around in all directions. Some professors state that they are the authors of the material, but forgot that, in all likelihood, they licensed all their patrimonial rights to their editors.

This is a reality of a series of economic and social causes. Brazilian book market features high prices and concentration. Most library collections are deficient and incomplete, and

63 For instance we find a pro-publishers bill # 1197/07 (prohibiting Universities to carry photocopy machines at all) and a pro-students bill # 5046/05 (Authorizing single copies of full books by college students for non-commercial purposes and recently amended to authorize copies just of out-of-print books http://www.camara.gov.br/sileg/MostrarIntegra.asp?CodTeor=295013)
64 In the USA, for example, you have “Make Textbooks Affordable” student movement (http://www.maketextbooksaffordable.org). A similar effort in Brazil – “Copy of Books is a right” – did not last for so long, having faced industry pressure and threatens of legal actions.
a great part of adopted books are out-of-print or were never published in the national
territory.

A study carried by IDEC$^{65}$ - a consumer’s group - in 2008 calculated the costs of
acquiring the class material for disciplines such as law, economics and business, for the
first college year at some public and some private teaching institutions. The results were
dramatic. The average cost in public institutions were R$ 2578.46 (around US$1467.72
in January 2010) and in private ones R$ 3907.89. Another striking results was that almost
1/3 of the books were out of print and thus not computed in the average costs. IDEC also
investigated the situation of institutional libraries and discovered that the average
collection numbered no more than 6 books per 100 students at public institutions and no
more than 8 in private (for numerical context, USP law first year course has 450
students).

The study carried on by the Grupo de Pesquisa em Politicas Publicas para o Acesso a
Informação (GPOPAI) at the University of São Paulo (USP) shows similar results. They
evaluated the cost of all professional books required in 10 courses at USP compared with
the average monthly income. The conclusion was that $\frac{3}{4}$ of the students had a cost related
to acquiring books superior to their family monthly income. For context, the current
Brazilian monthly minimum wage is R$ 465.00.

Another result from the GPOPAI study brings similar observations in relation to out-of-
print books: 1/3 are out-of-print and were not counted in the costs computed in the study.
Additionally, a study conducted by Sá Earp and Kornis, published in 2005, concludes
that the relative price of a book in Brazil is 270% higher than in Japan and 150% higher
than in the United States$^{66}$.

In response to this set of interlocking problems – high costs, an unclear limitation to the
right of copyright holders and a increasing pressure from the students under the flag

---

http://rodiziocultural.blogspot.com/2008_05_02_archive.html

“The Copy of Books is a Right” – some Universities have fueled the fire and issued internal resolutions adopting 10% as the meaning of “short extracts.” This stance resulted, as mentioned above, in a threat from the International Intellectual Property Alliance through its Special 301 blacklist and the consequent revocation of such University resolutions.

Business associations in Brazil echoed these international threats. The Brazilian Association of Reprographic Rights (ABDR) refused to accept the universities’ resolutions, increased the 2004 trend of revoking licenses and suing copy-shops, and began an extreme media campaign called “Copying Books is a Crime”. ABRD actions did not differentiate among cases where books were out-of-print, or rare, openly licensed through Creative Commons, or even in the public domain. At the policy and legal level, ABDR pushed for restrictive bills to entrench their point of view into law, though without success so far.

VI.7.b. - Professional and Scientific Books in the context of high education

Both the IDEC and GPOPAI studies mentioned above reach similar results when investigating who pays for greater part of the production of Professional and Scientific textbooks adopted by Brazilian Universities. For instance, the results from the sample collected by GPOPAI show that the market for professional and scientific textbooks responds for 25% of titles and 7% of sale-unities. This amount responds for 20% of sales of the publishing market – the equivalent to R$ 418,550,460,26 in 2006.

Additionally to the direct public spends, since 1960 and reaffirmed by the article 150 of the 1988 Brazilian Constitution, the publishing industry (books in all its forms, newspapers and magazines) is tax-exempt. In 2004, the publishing industry was granted additional benefits and freed from an obligation to make contributions such as PIS/PASEP (Social Integration Program) and COFINS (Contribution for the Financing of Social Security). These tax (IPI and ICMS) and contributions (PIS and COFINS) exemptions, which affect both final product and the production process (including, for instance, the paper used) supported the objective of reducing the final price of the product.

67 Currently, ABDR has abandoned the campaign “Copying Books is a Crime” – at least in its direct aggressive form – and has departed to efforts of fostering new business models to facilitate access to educational materials through the closed and paid project “Professor Virtual Folder” (Pasta do Professor). https://pastadoprofessor.com.br/portal/

68 “Article 150. Without prejudice to any other guarantees ensured to the taxpayers, the Union, the states, the Federal District and the municipalities are forbidden to:
VI - institute taxes on:
(…) 
d) books, newspapers, periodicals and the paper intended for the printing thereof”
Relying on the data collected, GPOPAI estimated that from 2001 to 2006 the subsidies (formed by the tax and contribution exemptions) represented a windfall of around 30% of the equivalent to sales. For the sake of comparison this subsidy represents two times the full budget of the Brazilian Ministry of Culture over the same time period.

However, even with all the public purchases and the incentives and exceptions – which aimed to broad the access to educational materials, what we see are instead increasing prices, sales and a lack of transparency regarding publishers profits, costs, and losses.

The government also plays a major role in the markets, with taxpayer monies the largest single investor in scientific and professional books for higher education in Brazil. This role of “single investor” plays out in multiple areas which give origin to the textbooks: since unlike most countries, the federal and state public Universities in Brazil are free 69, the payment of salaries for employees and professors come from the University budget (and this from the government) and a great number of scholarships, including for master and doctoral level, are provided.

Additionally, the majority of public institutions maintain their own academic publishing units, also supported by the University budget (in the sample collected by GPOPAI around 10% of the adopted books were published by University Presses).

The result of this scenario is a concentration of textbooks written by professors: one of the results showed, for instance, that 86% of the books in the GPOPAI collected sample (1910 books adopted by 25 different courses in more than 14 institutions) were authored by full time employed professors from public institutions.

In numbers, as calculated by the GPOPAI Report, the total invested by universities and public financial agencies (such as FAPESP), through scholarships and publication grants, is R$ 78,409.53 in 3 years per master thesis per student and R$ 155,344.04 in 3 years per doctoral thesis per student.

Furthermore, by comparing these values, with the value invested by publishers of books coming from the thesis, GPOPAI arrived in incredible: 17.9% of the total cost of a book based on a master thesis comes from private investment, while 82.1% from public investments; while for doctoral thesis, 9.9% comes from private, while the remaining 90.1% comes from public investment.

An important role is also played by University Presses. Researching a sample of 29% of University Presses in Brazil, the majority from public institutions and among the group

---

69 There is no annual or monthly tuition, the students are responsible for the cost of books and living costs. Students in order to attend the most prestigious public colleges and universities have to take a national exam and if approved they start school a couple of month later. Under Lula administration, the government also adopted a program of cotes for students that declare their race as black (what has driven great discussion and a current judicial law suit, since for many the reason of inequality in Brazilian Universities is based on poverty and not race).
with most market expression, GPOPAI analyzed 10 items that could be subsidized by the University: taxes, rent, water, light, salaries, transportation, telecommunications, workshops and training, mail and marketing. More than 90% of the sample has 91% of these items paid by public universities or related institutions; while 55% has all 10 items paid. The average of the support was 66% (direct or indirect) of the total costs of the university press.

Asked about the out-of-print books, which are part of the university presses’ catalogs, 85% of the interviewees answered in favor of making them available online in a print-on-demand model and 77% in favor of making the books openly licensed. None of these models are in place in Brazil as of 2010. This may change with the expected launch of Scielo Books.

**VI.7.c. - Textbooks in the context of “K-12” education**

**VI.7.c.1. - Conceptual Aspects**

*i. The textbook as a teaching tool in Brazilian “K-12”*

To understand the educational materials (EM) situation around “K-12” textbooks in Brazil, a quick grounding of the current status in the history of Brazilian textbooks, and their relation to government, is essential. Brazil has undergone a relatively rapid set of political transitions in the last 60 years that have marked the educational materials system in a lasting way. Brazilian policy and actions in this space are marked by a significant emphasis on philosophy around learning and the status of the textbook itself as an object impacting education in multiple dimensions. Thus, the textbook is a central part of a historical effort to change the educational system in Brazil, stretching from before World War II to the present day. And this status may present a series of barriers and opportunities for the growth of OER and for recommendations regarding the model of public purchase of textbooks by the government with taxpayer money.

In his article “The History of Textbooks and Editions: Regarding the State of the Art,” Allain Choppin presents an interesting discussion about the main problematic areas identified and the themes of historic research on textbooks and editions. Textbooks assume four key functions in his analysis, which parallels much of the experience in and around textbooks in Brazilian education:

- The first role refers to its reference as support for the necessary educational content.

---

70 The author is deeply thankful to Prof. Carlos Castanha - and awarded Brazilian history professor - for his the assistance on research and writing.
• The second role refers to the instrument, in other words, the implicit methodology that takes the students through the learning process by way of activities and exercises.

• The third role, which is older, situates itself in the condition of textbooks as instruments of ideological circulation, culture and the values of the leading social classes.

• The fourth role, connected to the formation of the teacher, is documental. Through text or iconic documents it aims at the critical development of the student.

Every proposal that is geared toward the creation of a system that favors the utilization of open educational resources will have to pay attention to this fact: in Brazil, a textbook is contemplated as an organized “corpus” with specific goals, and is rooted in a coherent methodology. The methodology of teaching with textbooks follows a defined path: the ruling systems make a choice of books that have a direct relationship with the political and teaching supported by the ruling system. In the case of Brazil this connection became very evident in 1996 when the first systematic and continuous evaluation system of textbooks used in the public school system was created. (The experience of creating the National Curriculum Parameters (PCN) and the impact that a policy change can have on textbooks, and in turn of textbooks policy on education, is examined in the next section and informs the recommendations of this Green Paper related to textbooks.)

Additionally, from the perspective of teachers, there is a great attachment to the textbook for a series of reasons, which may generate great cultural resistance to changes toward openness and toward the digital. While from the perspective of publishers, open and digital are the great challengers for their current business models and years of relationship with the government-buyer. Failure to take this historical, cultural, political and economic reality into account endangers the potential success of OER attempts in the textbooks space. But these challenges cannot be seen as impenetrable barriers.

**ii. Quality and PCN’s**

The beginning of the 1990s marked the first steps taken by MeC in regards to effective participation in the evaluation of the textbooks. The new Law of Guidelines and National Education (Federal Law n. 9.394), approved on December 20, 1996, largely defines the methodological direction of education in the country; inserted within this context are the PCNs (National Curriculum Parameters). The PCN became the reference document prepared and adopted by Brazil to redirect the entire educational system. In this reference there is a specific methodology that serves as the founding structure of this entire new system.

The methodology developed by the PCN can be summarized in the terms found in its document, terms such as “learning to learn”, in other words:
• Today, more than ever, schools must present the need to assume themselves as a *social space for the construction of significant and necessary ethics* for every action regarding *citizenship*.

• Basic education plays the role of guaranteeing conditions so that the student can build instruments that give them the skills for the process of *permanent education*.

• It is necessary that the following be explored in the process of teaching and learning: the *learning of methodologies capable of prioritizing the building* of verification strategies and evidence of hypotheses.\(^{71}\) (Emphasis added by author)

The goal is to educate learners that are capable of participating in the building of knowledge, argumentation, and the development of the critical spirit in favor of creativity. This is in many ways counter to the traditional “read only” systems of education, which are the dominant forms of education actively supported by the government (though of course alternative systems are not prohibited).

The orientation proposed in the National Curriculum Parameters recognizes the importance of the constructive participation of the student and, at the same time, the intervention of the teacher. Contrary to the concept that teaching and learning is a process that is developed in steps, in which each step ends with the knowledge learned, PCN proposes a vision of complex and provisional knowledge.

However, even with the recognition that knowledge is not linear, Brazil school are still based in the “Traditional teaching” system\(^{72}\). It is clear that there is an enormous advantage for those that know how to operate within this system and transform information into knowledge – a financial advantage in some cases for content producers. For many education specialists that met at 1990 the Worldwide Conference of Education for Everyone\(^{73}\), the methodology chosen by Brazil with the adoption of PCN’s seems coherent - especially if one takes into account developing countries with the world’s largest populations - but it is definitely a pre-network approach.

### iii. Evaluation of “K-12” textbooks

\(^{72}\) A proposed way of education that centers on the teacher, whose role is to look out for the students while counseling and correcting them as well as teaching the material. In the majority of schools this teaching practice is characterized by a load of information that is given to the students, with the textbook as primary container. The logical organization of the course materials is the key thing that guides the teaching of content. The teacher is an authority, an organizer of the content and teaching strategies and, therefore, the primary guide of the entire educational process. The Brazilian learner sits in Lessig’s “read only” world.\(^{73}\) [http://www.unesco.org/education/efa/ed_for_all/background/world_conference_jomtien.shtml](http://www.unesco.org/education/efa/ed_for_all/background/world_conference_jomtien.shtml)
In 1996 criteria were defined to evaluate textbooks. It was established that books with any of the following criteria were to be eliminated:

- books that express prejudice against origin, race, gender, color, age or any other type of discrimination;
- books that induce one to error or contain serious mistakes in relation to their content, for example, conceptual mistakes.  

The analysis of the books offered up until then generated a classification into four large categories:

- Excluded – category made up of books that presented conceptual mistakes, induced one to err, outdated, prejudice or discrimination of any kind;
- Not recommended – category that constitutes manuals in which the conceptual dimension is insufficiently presented, and things were found that significantly compromised the didactic-teaching efficiency;
- Recommended with exceptions – category made up of those books that have minimal qualities that justify their recommendation, even though they also present problems that might not compromise efficiency if taken into account by the teacher; and finally,
- Recommended – category made up of books that correctly fulfill their role, satisfactorily meeting all the normal and specific requirements as well as the criteria most relevant to the area.

In the field of publishing there has been a growing improvement in the standards of quality as a result of this policy. The percentage of books that are recommended has been increasing as the publishers increase the number of works that are positively evaluated and reduce the number of rejections. Receiving the positive evaluation mark from PNLD became a market need for publishing companies, who renew their books and adapt them to more progressive methodology demands – from there we can see the investment in quality. For instance, in relation to PNLD/1997, 118 of the titles registered in PNLD/1998 were new; in PNLD/2000-2001, 315 new titles were registered in relation to PNLD/1998. However, even with this quality improvement, textbooks with major errors have arrived in Brazilian school – such as the story on a book with a wrong South American map illustrates.

Thus, for a material to be officially adopted within the Brazilian public system schools, it must pass through the scrutiny of the National Curriculum Parameters. However, the adoption of open educational resources and opening textbook evaluations would create new opportunities of transparency to this process and increase quality due to the many eyes of teachers, students, community, government, each involved in editing and quality control.

---

iv. Formation of teachers

Data show that teachers have a tendency to choose the books with the worst quality, or those that obtained very poor evaluations by PNLD\textsuperscript{75}. According to Batista (2003), this is grounded in the low quality of education of these teachers.

The process of the popularization of education carried out in the last few decades has the ironic side effect of weakening the average strength of a teacher. Non-competitive wages and a lack of benefits for the career teacher do not create a large, skilled pool of educators. This situation is worsened by the absence of motivational instruments and alternative incentives, turning the profession into one that is not very attractive to the middle and upper classes of society.

There are also a large number of problems in the institutions that offer teaching degrees. Those courses attract students from the lower social classes, who see a teaching career as a way to get ahead because there are many positions available in the public system. These future teachers usually study for their undergraduate degrees at night in private institutions, attempting to reconcile work and studies.

It is important to pay attention to this reality when searching for possibilities to apply open resources for education in Brazil. Brazil needs investment and implementation of feasible programs for the continuous formation of professionals in the area of education, and these programs should prepare teachers to deal with open resources. Moreover, the development of incentive policies (such as prizes) along with the formal recognition of contributions made in the collaborative development of and adoption of open educational resources – also as a strategy of continuous training and development of technology and methodology skills\textsuperscript{76} - are key.

\textsuperscript{75} Taking into account PNLD/1997, around 72% of the teaching choices fell within the non-recommended books, and only around 28% within those recommended. In PNLD/1998, even though the total number of books recommended (with distinction, 21.88%; with exceptions, 22.15%; or simply recommended, 14.64%) made up the group most chosen by teaching staff, the category, which, on its own, demonstrated itself to be the most widely represented was the non-recommended group (41.33%). Finally, in PNLD/1999, the choices by teaching staff, with the elimination of the non-recommended category, fell predominantly within those recommended with exceptions (46.74%), and those recommended with distinction only represented 8.40% of the choices. (Batista, 2003, p. 50).

\textsuperscript{76} Eventually these resources and new technologies could serve as tools for continuous education, even more so when we observe the great difficulties of implementing formation programs due to the enormous distances within the country and the costs involved.
V.7.c.2. – The “k-12” textbook market

i. Who pays and how much for textbooks?

Through the Ministry of Education, the Brazilian federal government operates three programs geared toward the textbook: the PNLD (National Textbook Program)\(^ {77} \) that meets the demands of students registered in elementary education; the PNLEM (National Textbook Program for Secondary Education)\(^ {78} \) that meets the needs of secondary school students, and the PNLA (National Textbook Program for Youth and Adult Literacy)\(^ {79} \) that meets the needs of youth and adults that have already finished the regular school phases, but wish to continue their education to receive their formal diplomas.

The textbooks of the courses corresponding to the school year are distributed free of charge to all students registered in elementary school, high school and for young people and adults that participate in the Brazil Literacy program\(^ {80} \). It is an action by the Ministry of Education that aims to eliminate illiteracy in the country.

FNDE (National Fund for the Development of Education)\(^ {81} \), a federal subordinate agency of the Ministry of Education executes all actions to acquire and distribute textbooks in a centralized way; therefore there is no transfer of resources to the states or municipalities for this end.

The tally of the number of books and their destination is based on an annual census carried out by INEP (National Institute on Educational Research and Studies)\(^ {82} \), a subordinate agency to the Ministry of Education. That census provides the data on the number of students registered in state and municipal schools, as well as other relevant information to monitor educational levels in the country.

Specifically between 1994 and 2005, PNLD acquired 1.077 billion books for use in the school years between 1995 and 2006. They were distributed each year to an average of 30.8 million registered students in about 163.7K schools. In 2007, PNLD bought 110,241,724 books to be used in the 2008 school year. This acquisition cost R$ 559,752,767.00. Books were acquired for every course and discipline for the 13.4 million students from 5th to 8th grade (or grade nine for the schools that have adopted this teaching level over a period of nine years) and for all of the students in kindergarten, as well as those who must repeat grade one, two or three\(^ {83} \).

---

\(^ {77} \) [http://www6.senado.gov.br/legislacao/ListaPublicacoes.action?id=218965](http://www6.senado.gov.br/legislacao/ListaPublicacoes.action?id=218965)

\(^ {81} \) [http://www.fnde.gov.br/](http://www.fnde.gov.br/)

\(^ {82} \) [www.inep.gov.br](http://www.inep.gov.br)

All of the resources used for the textbook programs in the country are financed by the general budget of the federal government, obtained through a tax called “salary-education.” In 2008, the total gross amount collected was R$ 8,863,800,740.28.

The functioning of the textbook programs falls under the following phases:

- The first phase is the registration of publishers. These companies (publishing companies that hold copyrights) must follow the rules established in the proclamation published in the Official Gazette of the Union and on the program sites. This way they present their works for evaluation by SEB (Secretary of Basic Education), an agency connected to the Ministry of Education. The same proclamation determines the deadline for the presentation of works by the publishing companies.

- The second phase is the selection & evaluation of publishers’ works. In this phase the works are analyzed by IPT (The São Paulo Institute of Technological Research) for a physical and technical evaluation of the books (quality of the material used, durability, resistance, etc). The approved books are sent to the Secretary of Basic Education (SEB), who is responsible for their evaluation. SEB recruits specialists that prepare the book’s summaries in order to create a manual of the textbook.

- The third phase is where the textbook manual is made available and then sent on printed material to the schools registered in the school census carried out by INEP.

- The fourth phase is the choosing of the books directly by the teachers and principals of state and municipal schools.

- The fifth phase is the order. The teacher orders desired works by filling out an electronic form available on the internet or manually through a form sent through the mail.

- The sixth phase is the acquisition. FNDE compiles the information from the data received via internet and through the mail, and then carries out a centralized negotiation with the publishers. The centralization is desirable mainly due to the large quantities of orders and subsequent lower prices when compared to a single book order process.

---

84 The salary-education tax was instituted in 1964 and is a social contribution (tax) destined toward the financing of projects, actions and programs that are geared toward basic public education. That contribution is laid out in section 212, § 5º, of the Federal Constitution and regulated by laws 9.424/96, 9.766/98, Decree nº 6003/2006 and Law nº 11.457/2007. This tax is calculated on a 2.5% percentage base on all remunerations paid by companies. It is collected and inspected by the Federal Revenue Agency, an agency connected to the Treasury. The taxpayers of the salary-education tax are companies in general as well as public and private entities connected to the pension system. It is up to FNDE to redistribute the resources obtained from these taxes.

85 Source: System STL/DIFIN/CGFSE/DIASE
In PNLD/2009, for example, the average cost of the pre-print version of the textbooks was RS$0.3493, and the final printed version was of an average RS$5.00 per unit. The single unit value in bookstores where private school students acquire their material varies a great deal, depending on the title, publisher and the bookstore, but is generally much higher as an average. Following are some examples:

- **Novíssima Gramática da Língua Portuguesa - Novo Acordo Ortográfico (New Grammar of the Portuguese Language – New Agreement on Spelling) - 48ª Ed. 2009 (editora Nacional) (Publisher) = 79.90 reais**
- **Geografia do Século XXI - Brasil : O Despertar de uma Grande Potência (XXI Century Geography – The Awakening of a Great Potential) - 6º Serie (5th Grade) - 2º Edição (2nd Edition) 2005 (ed. Positivo) (Publisher) = 71.00 reais.**
- **Geopatlas - Brochura (ed. Ática) (Publisher) = 51.90 reais**
- **Atlas Geográfico Século 21(21st Century Geography Atlas) (ed. Ática) (Publisher) = 24.90 reais.**
- **Tudo É Matemática (Everything is Mathematics) - 6º Ano - Conforme a Nova Ortografia (According to the New Spelling Rules) (ed. Ática) (Publisher) = 68.90 reais.**

- The seventh phase is the production phase when FNDE closes the contract and divulges the number and locales for delivery of the textbooks. The publishers proceed to produce the works with the supervision of technicians from FNDE.

FNDE is in partnership with the Institute of Technological Research (IPT). This institute is responsible for collecting samples and for the analysis of the physical characteristics of the books in accordance with specifications from the Brazilian Association of Technical Norms (ABNT), ISO norms and procedural manuals that have already been prepared.

- The eighth phase is the distribution of the works. This is carried out directly by the publishers to each and every school. This distribution is carried out through a contract between FNDE and the Brazilian Post Office (ECT).

- The ninth phase is the receipt of the books. The city schools receive their books between October and the start of the school year. The rural areas receive their books through the Secretary of Education from their respective municipalities.

São Paulo is one of the states that opted for decentralization. This means that FNDE transfers the financial resources for the acquisition and distribution of textbooks and the Secretary of Education has total autonomy in regards to the choice of titles.

### ii. The Brazilian Model of the Publishing Market for Textbooks

Up until the 1990’s there were nine publishers that practically dominated the textbook market in Brazil, including: Saraiva, FTD, Cia. Editora Nacional, Editora do Brasil, Atual and IBEP. Most of them started as “national” family-
owned companies with exception of FTD, which has foreign origins (the religious order of Irmãos Maristas Francesa).

All of these companies benefited from an increase in the number of students during the 1970’s, and consolidated their corporate structures atop the new investments in education by the state, with the objective of increasing access to public schools. This development of the publishing companies was always parallel to government incentives. Generally it was increasing society taxation in order to expand public education that funded the expansion and solidification of the publishing houses.

However, the 1990’s were a period in which the country opened up to foreign investment, and in the publishing market of textbooks there was a clear movement towards a concentration of capital and market power into the hands of fewer and fewer parties. That concentration has crystallized through five large publishing groups that absorbed the smaller national and family-owned businesses, and dominate the very lucrative market of Brazilian textbook publishers. They are:

- Grupo Abril (The Abril Group): in 2004 it took over shareholder control of the publishing companies Ática and Scipione.
- Grupo Positivo: Brazilian origins by way of Editora Nova Didática, inserted itself into the market by selling teaching systems The Grupo Positivo has a growing participation in the country’s computer market.

Each publisher built their own “story” of corporate origins, which are often tied into the personalities of the founders. The first ones in the early 1900’s (the case of FTD), went through the 1920’s as Cia. Editora Nacional with the founders Monteiro Lobato and Octalles Marcondes. The company Editora do Brasil arose in the 1940’s from teachers who were ex-employees of Cia. Ed. Nacional. Saraiva was founded by Joaquim Ignácio da Fonseca Saraiva. It started out as a small vender of legal books next to the Largo São Francisco School of Law. The publisher Ática was founded in the 1960’s by Medical Students from the University of São Paulo School of Medicine that opened up courses for youth and adults that had already passed the normal age for school studies. The demand for the need of course materials justified the creation of the publishing company. This publisher innovated and created a system that took into account teacher’s books (with answers and guidelines for the teaching staff), student books (to follow the content), and the exercise notebook (a notebook to do the exercises that were proposed). The teacher’s book as a rule is a market trend for evaluation on the part of the present PNLD.
The increasing power – economical, market and political – of these publishing groups generates great barriers to entry of independent publishers in the textbook market in Brazil. These barriers are related to the high investments necessary to introduce a textbook collection in the public school system, which benefits the conglomerates and acts as a control point on market entry by startups and entrepreneurial publishing ventures.

**ii.a. Expressions of market power**

Also, the economic power was invested in marketing control: the corporate groups concentrate their efforts on marketing and spread their material to those who have the power to help sales – the teacher. In the 1990’s, it was common for companies to hire people to market directly and strictly with teachers and school principals from public schools, since these were the people who would decide on the books that would be used.

To combat this practice, laws were created to restrict access by these marketers in the public school system. The goal was to allow teachers, schools, and the government to try and make the choice free and unbiased. The present PNLD (National Textbook Program) also came into place to act as a filter for the teacher who chooses the books: the Handbook of Textbooks – developed by renowned technical specialists hired by the government – arrives on the hands of the teachers after a selection and classification of the available textbooks.

Another strategy of publishers is the creation and distribution of promotional folders and catalogs to spread the collections beyond sending samples for the teachers to choose. Advertising this way is very expensive - there are around 178,000 public schools spread throughout the entire country. Speeches or large gatherings with specialists and authors are also common practices used today. This is another way in which market forces mitigate against disruptive new entrants.

In the case of private schools the strategy is to make the largest schools their number one priority, since they represent the largest number of sales, although in total approximately 10% of all of the educational institutions in the country are private. The earnings from private schools are greater than the share of institutions overall, however. Private schools lack the market force of centralized purchase, and buying books one at a time costs five times as much as those sold to the state.

More recently the publishers began to use ads on TV and the radio, mainly those used by companies that promote teaching systems. They are sold as a successful system because they originate from private schools. Private schools have an image that equates to a better education than the public system for the simple reason, even if minimal in nature, that they are able to escape the misfortunes of the public school system, such as: low teacher

---

salaries, very poor physical structures and conditions, violence within the schools, unstructured teaching methodologies due to low quality of the teaching staff, among others.

The strategy, considered aggressive by many educators, brings about results in a population that is used to seeing the process of waste in the public school system. This fact can be observed in the evaluations at the end of school terms: Elementary and Secondary Education, promoted by the Ministry of Education.

VII. - Brazilian Experiences: The Tropical OER

Brazil, under the current government and the leadership of the Minister of Education Fernando Haddad, invests in distance education and digital inclusion projects in parallel to traditional programs to train professors as its main strategy to education improvement and democratization. As Anna Christina Nascimento, a Secretary of Distant Education (SEED)’s project coordinator noted: “Distance learning programs seem to be the best alternative to provide opportunity for students who, because of background or economic conditions, do not have access to education in their community.”

Some of these projects have similar goals of those aimed by Open Educational Resources – as we are going to see within the analysis below - but much still to be developed, including a clear understanding of the concept and benefits of truly open educational resources and that openness is more than distant education and digital inclusion.

To understand what is missing, this section of the Green Paper will map some of the projects developed under the SEED at the Ministry of Education (MeC) and perform an analysis of their design, with special attention to how each one relates to the concept of OER. The initial analysis here demonstrates that the lack of a clear policy around the terms of provision of educational resources has resulted in projects misclassified as “open” under generally accepted international conditions for OER. A side effect of this lack of clarity and adherence to international standards for OER is a certain insecurity from the part of teachers that are accessing the resources, who do not understand the boundaries of what is and is not possible in terms of academic creative reuse and redistribution.

The research laid out in this section represents a significant source of the recommendations advanced elsewhere in the Green Paper. Under the name of each project, we insert a box with the linking the project to the type of recommendation formulated.

VII.1. - Open University of Brazil

The Open University of Brazil – UAB is an initiative started in 2005, resulting from partnership among public universities, states and cities governments, and coordinated by MeC. It is not a new institution or university, but instead a network of institutions and universities that aim to bring higher education to the municipalities where no superior program is offered or where, when courses are available, they are insufficient for the existing demand.

**Related Recommendations:** “Content / Technology policy”, “Content / Pedagogy policy” and “Content / IPR”
One of the UAB’s primary concerns is the initial and continuing education of public school teachers, mainly for the fundamental learning cycle through the offer of distance learning courses.

The courses are offered through learning centers built by the cities, each including a library and science labs for computer, physics, chemistry, and biology. The learning center also offers the students a face-to-face tutoring. The public higher institutions involved in the UAB network are responsible for the courses development as well the instructional materials. Currently, there are 74 institutions (access points) composing the UAB network, 728 learning centers where 550 courses are being offered through UAB access points. There is no unified policy, terms of use or license of the material produced and used under the UAB. Additionally, there is no clear technical standard – the materials probably vary from printed copies and textbooks to online resources distributed by each UAB access point.

However, the use of the word “open” within this project should not be understood as open as in here-adopted definition of OER. The courses offered by the learning centers are free of charge for those selected. The selection process follows the public entry exams rationale common to the public higher educational system in Brazil. The materials are not available for those not formally enrolled and no part of the content is available online. Also, the lack of open licenses or a clear federal policy regarding the ownership of the content produced by the Institutions involved within the UAB but paid by the federal government, probably means that each institution, or even worst, each author – professors or hired consultant – owns the copyright over elements of the content developed for the courses offered through UAB.

VII.2. - Digital Educational Repositories

Since 2003, the MeC has invested in the development and provision, through different process and methodologies, of learning objects. Learning objects are digital educational resources, which are developed within certain standards so it is possible their reuse at different educational contexts. They are stored in educational repositories, and they must be catalogued, so users can easily find them. Some examples are: texts, e-books, quizzes, course syllabi, courses, simulations, presentations, audio and video files, etc. The two main projects in this area are the Interactive Virtual Network of Education (RIVED) and the Public Domain Portal.

VII.2.1. - RIVED\textsuperscript{98}:

\begin{flushright}
\textit{Related General Recommendation: “Content / Technology policy” and “Content / IPR” (Specific project-related recommendations are presented under each Repository)}
\end{flushright}

\textsuperscript{98} \url{http://rived.mec.gov.br/site_objeto_lis.php}

58
Interactive Virtual Network of Education - RIVED’s current goal is to improve the role of the teacher as a facilitator and leader of the teaching/learning process, and to enhance the role of the student as a learner, thinker, investigator and problem-solver.

In 1997, Brazil and United States signed an agreement to develop technology for educational use. Brazil's effective participation began in 1999 through a partnership between the Department of Secondary Education and Technology (now Basic Education Secretary - SEB) and the Distance Education Secretary (SEED). In Latin America, Peru and Venezuela joined the effort with Brazil. The pilot enterprise aimed to produce technology-rich learning activities and objects to support teaching within the participant countries, to support and be incorporated within the scientific curricular goals of each partner.

By 2003, SEED was responsible for the production of 120 learning objects of Biology, Chemistry, Physics and Mathematics for Secondary Education. In 2004, SEED transferred the production process of learning objects to universities, through a Project named “Virtual Factory”. The participation of Universities (18 by 2009) within the Virtual Factory made possible the expansion of learning objects production into other levels, such as the production of content for other areas of knowledge, for basic and vocational education, and for other special needs. It also enabled and incentivized the participating institutions to share their best practices, learning activities, strategies and experiences.

The international and partnership shape that characterized the project in its birth has shown the benefits of a flexible enough policy that would allow the re-use and adaptations of objects for local needs.

The learning objects, the majority in Portuguese, are divided into knowledge areas and retrieved by a search mechanism. They are accompanied by a teacher guide that provides suggestions on how to use the material, how to build activities and classes around it, how the teacher should prepare herself and the students, the minimum knowledge required, and the knowledge objectives aimed by the activities.

The learning objects retrieved from the RIVED database do not have any open license attached to them – so, until this moment, we assume they are fully protected and closed following what the copyright law establishes. The website also does not have any specific terms of use or copyright notice. The section “How to use” features a tutorial on

---

99 In the past, this repository was known as in the past known as International Network of Virtual Education.
how to use the repository, including a short online course. The only place which brings any reference to copyright is the RIVED website Q&A, where one reads:

“Can I copy the objects published by the RIVED site? All objects that have the ‘download’ button can be copied and reproduced, you just need to click on it and save in your machine. The contents can also be saved in CD-Rom and sent to schools and other learning institutions without Internet connection. They can also be reformed and re-edited, however the original authorship needs to be acknowledge.”

Additionally, the RIVED home page now carried a notice that:

“Use License: the contents produced by RIVED are public and will be, gradually, licensed thought a Creative Commons license. These contents can be accessed through our search tool in our online repository, which allows you to see, copy and comment the published contents. With the Creative Commons license, the author rights are guaranteed and it will be possible for others to copy and distribute the material, with the proper attribution to the authors.”

However, there is no specification within the RIVED system as to which CC license will be adopted. Thus, we expect that RIVED will face a long process of licensing-in all the rights from the resources it carries – process which would be much easier if RIVED had included a copyright assignment, including express rights to license to others under any regime, in the original agreement/contract with the original authors.

It seems, from the mission that accompanied the project since its birth, and the possible uses allowed through the Q&A and this notice in the home page of RIVED that CC-BY is the most appropriate license. Alternatively, CC-BY-SA could also be used.

VII.2.2. - International Bank for Educational Objectives

The International Bank for Educational Objectives is a repository created in 2008 by MeC, in partnership with the Ministry of Science and Technology, the Latin American Network of Educational Portals (RELPE), and the Organization of Ibero-American

Related Recommendations: “Content / Technology policy”, “Content/Pedagogy policy” and “Content / IPR”

The International Bank for Educational Objectives is a repository created in 2008 by MeC, in partnership with the Ministry of Science and Technology, the Latin American Network of Educational Portals (RELPE), and the Organization of Ibero-American

http://rived.mec.gov.br/site_objeto_lis.php
Countries (OEI), among others. It was developed using DSpace – an open-source platform for accessing, managing, and preserving scholarly works, developed by MIT Libraries and HP Labs.

The International Bank aims to maintain and share digital educational resources (in a variety of more elaborate formats than simple documents) for free access by a community with different realities and languages, in general Portuguese and Spanish. Examples vary from audio, video, animation, simulation, educational software - in addition to image, map, hypertext considered relevant and appropriate to the reality of the education community place, respecting the differences of language and regional cultures. This repository is integrated with the Teachers Portal (see below).

When explaining which kind of material is accepted by this repository, the official description of the International Bank within the Ibero-American Countries portal\textsuperscript{102} states that:

“ The Ministry of Education will accept educational resources that have been licensed in the following ways:  
* License given by the author or his representative directly to the Ministry of Education, enabling reproduction, translation, distribution and transfer.  
Other licenses such as:  
* Resources licensed through a Creative Commons license that allows the reproduction, translation, distribution and transfer.  
* Resources licensed through a the terms of use of a institution’s site that allows the reproduction, translation, distribution and transfer.”

However, an analysis of a sample resource downloaded from the bank shows that the licensing situation of the bank is complex and not uniform, causing great difficulties to the users in understanding how they can actually use the contents retrieved from the bank and the level of resource interoperability.

The sample showed that the user of the bank can find resources without any notice on copyright license (which may mean that the object is fully copyrighted, having “all rights reserved”, since the Bank does not have a unified policy to deal with this type of case), resources licensed with different Creative Commons licenses and resources that bring their own and specific use conditions – reality that generates a lack of legal interoperability and its consequences.

VII.2.3. - Public Domain portal

\textsuperscript{102} \url{http://www.oei.es/noticias/spip.php?article2886}
The Public Domain Portal is a digital library developed on a free software platform, launched in November 2004. Its mission is the collection, integration, preservation and sharing of knowledge, and promotion of the broad access to the literary, artistic and scientific works (in the form of text, sounds, images and videos), which are part of the Brazilian and Universal cultural heritage. Additionally, we read in its mission, signed by Ministry Fernando Haddad:

“the ‘Public Domain Portal’ [aims] to provide information and knowledge in a open and free manner, seeking to encourage learning, innovation and cooperation between the generators and users of content, while leading a broad discussion on copyright - so that ‘some rights reserved encourages further uses’ - and an adaptation to the new paradigms of technological change, production and use of knowledge.”

Under its archive policy, the portal assures that the works digitized, published and accessible – a total of 123,510 in June 2009103 – through the site are in the public domain or licensed through a Creative Commons license.

In the area for authors, the site provides instructions regarding how copyright holders can contribute with the library. They ask the author to first license the work through a Creative Commons license and then send the work, with some specific archiving information and the license, to an email dominio@mec.gov.br. The Ministry of Education holds the right to refuse works and also the right to take down works and content in violation to copyright. The project also fosters collaboration from other stakeholders, such as institutions, translators and volunteers. In the case of the institutions, these are instructed to send an email to dominio@mec.gov.br in order to assign the copyrights.

However, the download of a sample of contents showed that not all contents have Creative Commons licenses associated with them and many are not in the public domain based on a simple count of years. It is true that many do not have a copyright notice or symbol in the material, however the Brazilian law – implementing the international copyright system – does not require notice for copyright to hold true. Thus, while recognizing that our sample is not statistically significant, it is fair to say that the examples we found break down the copyright statement from the Public Domain project.

Additionally, the site provides links to other project and digital collations, such as Machado de Assis, recent performances of Brazilian classical music and other

---

103 This number has risen to 145,128 as January 2010.
collections that are not in the public domain, with the great potential of generating confusion among the users and violation of copyrights.

Through the search engine at the Public Domain Portal, the user has access to a database of theses and dissertations. The download of a sample showed that the theses frequently do not carry any notice regarding their copyright license. Thus, a conservative user might interpret that the texts are fully copyright protected – which again can cause confusion, since the publication of copyrighted materials lacking open licenses on this site contradicts its mission.

Consequently, by putting “anything” under the flag “Public Domain” we believe that this project cause confusion in the minds of those not familiar with Copyright Law and loses a great opportunity to play an educative role in regard to those materials that are actually in public domain and what public domain means under the Brazilian law.

VII.2.4. – Thesis, Dissertations and Institutional Repositories

The thesis and dissertation are traditionally focal points of Open Access rather than OER. However, they represent essential material outputs of education and research in higher education institutions, and form in this sense part of a broader definition on Educational Resources in higher education. Brazil has made a series of policy and funding steps to ensure access to these resources, being a leader in the field of access to theses.

In December 2002, IBICT, linked to the Ministry of Science and Technology, launched the Brazilian Digital Library of Theses and Dissertations (BDTD) through the establishment of working groups and a network of Federal and State Universities. The mission of the BDTD is to make the national academic production available nationally and internationally. BDTD adopted Open Archives Initiative (OAI) technology and international interoperability standards, such as the NDLTD, to ensure interoperability of Brazilian information with international catalogs and search engines such as Oaister, Scirus, and Base, among others.

104 The theses are not “open” thought – they are not open licensed.
105 http://www.ndltd.org/
106 http://www.oaister.org/
107 http://www.scirus.com/
In February 2006, CAPES, the federal Brazilian agency for supporting postgraduate programs linked to the Ministry of Education\textsuperscript{109}, published Ordinance 13\textsuperscript{110} mandating all institutions (public or private) which offer masters and doctorate degrees to make student thseses accessible through publication on the Internet. The ordinance decrees that publication will be made through an institutional repository or through a national repository and all theses and dissertations published after March 2006 should be online within one year.

The language used in the mandate, stated in article 5\textsuperscript{th} of the resolution, is worth noting and might serve as a model for other policy positions around Open Access and OER:

“The funding of academic work with public money, in the form of scholarships or any kind of assistance granted to a master or doctoral program, implies the obligation of the master or doctor student to present it to the society that funded its research, applying to it the provisions this Ordinance.”

After this Ordinance, there were efforts to have BDTD be the centralized access point for research on the databases of thesis and dissertations, based on its legitimacy within the network of Universities and its technology and adoption of international standards, but these were unsuccessful.

Nowadays, there are two main e-thesis aggregators: IBICT, through the Brazilian Digital Library (an effort started in 2002, even before CAPES Ordinance 13, through the establishment of working groups with Federal and State Universities) – and the Public Domain Portal. As of July/2009 IBICT reported 91,975\textsuperscript{111} published works accessible through its databases covering the period of 2000-2009.

Thus, the theses and dissertations are now accessible through multiple access points\textsuperscript{112}, causing some confusion regarding how extensive any one database might be, and if any aggregators are really covering all available online Brazilian thesis and dissertations. It is important to note that many Universities also maintain their own repositories while sending information and digital archives to both IBICT and the Public Domain portal.

To deal with this problem, legislation was proposed in 2007 and recently approved in of the Brazilian House of Representatives (bill of law # 1.120) that requires public institutions of higher education to deposit the entire content of the technical-scientific

\begin{itemize}
\item Its mission has 4 main goals: to evaluate the graduate and post-graduate courses (master and doctorate); to foster the access and public communication of Brazilian science production; to invest in high-value resources through national and international training and to promote international academic cooperation.
\item http://www.capes.gov.br/sobre-a-capes/legislacao/2340-portarias
\item http://bdtdj.ibict.br/indicadores/graficoSHID.jsp?cod1=&cod2=&cod3. This number is 106976 as of January 2010cover both master and PhD theses.
\item CAPES (the Brazilian funding agency under the Ministry of Education) also provide a pilot search called Virtual Library of Theses, focused on history discipline – however this pilot does not bring much information of its story and mission and the author of this paper did not have the emails sent to the pilot coordinators answered.
\end{itemize}
production of students and professors into repositories. The bill establishes that IBICT shall lead a committee that will be responsible to develop a national policy of access to information, specifically access to the academic/scientific research produced in public institutions in Brazil. The project also unifies, under IBICT, the publication of the information regarding access to the institutional repositories.

The bill allows two exceptions. For the case of publications that had its rights previously assigned or licensed, the publication metadata needs to be archived and accessible through the institutional repository. The same rationale is applied to publications that are part of research aiming towards a patent application.

It important to notice that while the main goal of this bill is to provide “open” access to the national scientific production, the bill does not utilize the definition of open and based on the repositories already in practice. The “open” may be understood as “free / no cost” and not as having the publications under some kind of open license.

**VII.3 - Teacher’s Portal**

The Teacher’s Portal is an initiative from the Ministry of Education to integrate the whole public system of the equivalent to the K-12 education. It is target to create an environment where decision makers, academics, teachers and students are connected.

The Portal is organized into 7 sections:

(a) “Classroom Space” – a place to create, view and share lessons and classroom methodologies for all levels of education. Classes can contain multimedia resources such as videos, animations, audio, etc., imported from the Portal or external sources. Any teacher can: create and collaborate, develop lessons individually or in teams, search and explore the content of lessons. There are, for instance, 1138 lessons suggested within this space, the majority of which are focused on how to conduct a class focused on a certain kind of content. In the toolkit on how to build a classroom, there is a brief passage on page 5 stating that:

"After finishing your Classroom, do a good spell check, verify if all links are correct, working and published in the correct sequence. Check also the quality and size of images inserted and now you can post your Classroom suggestion for public access

---

through the Portal. For this, you just need to open the Classroom and click on ‘Save and publish’ after agreeing with the assignment of copyright.”

The checkbox the platform creates, as seen above, says:

“I agree with the publication of this Classroom for public access. This assignment of copyright allows copy, distribution, edition, and execution, if proper attribution is granted.”

This text follows by stating:

“This class material is assigned, freely and non-exclusively, to MeC for undetermined time. MeC has the right, under this assignment, to use the material in any way, including transfer it to other educational sites with no for-profit intent. If you do not accept this condition, you cannot public content within this site”.

However, when you access a Classroom (or a class material), this section or the Portal, no open licenses associated with the content created and published are visible or findable. Indeed, the home page of the Portal carries a copyright notice attributing all rights to the Ministry of Education. Thus, while the assignment pointed above may work between the author and MeC, the copyright notice which appear in the website restricts the use by the users of the website, since there is no clear notice in regard to the use of the material by third parties rather than MeC. Our conclusion is there are two possibilities: (a) the user has no right or (b) there is a great confusion in regard to how licenses work and affect one another, which, at the last instance may represent a great user barrier. Below, under the section “educational resources” we observe a similar net of incompatible licenses.

(b) “Teacher’s Newspaper” – 15-day publication with news from MeC and others related to education and the day-by-day life of teachers.

(c) “Educational Resources” – 3527 educational resources imported from the International Bank of Educational Objects. The user guide states that

“All resources published in the Teacher Portal can be downloaded - to your computer, pen-drive, CD, DVD or otherwise -, copied and distributed, being forbidden any for-profit use.”
However, a sample of materials has shown that each material has its own license, some licensed through CC, some not. Thus the standard statement is again not correct for all cases.

(d) “Courses and Materials” – Courses and materials focused on teachers’ continuous training. This section acts as an aggregator of external links to programs of continuous training coordinated by MeC and its partners. The majority of courses is registration-based only and face-to-face, being developed through a network of learning institutions.

(e) “Integration and collaboration” – This section fosters the adoption of web 2.0 tools by teachers in order to interact and collaborate with teachers, by supporting internal and external tools for the creation of groups, sharing of content, information, research and debates. Within the forums the hot topics are technologies for education.

(f) “Links” - This section acts as an aggregator of external links to national and international resources, institutions, courses, museums, software, etc. The criteria for having a link in this section are not clear. The main page of this section says: “National and International Sites and Portals to support the research by and continuous training of teachers”. Within the International links projects like Connexions and MIT OpenCourseAware are placed within the same list where BBC sites are listed, with no marks to indicate that some are compliant with international standards for OER while others are not.

(g) “Freire Platform” – national project dedicated to train teachers that do not comply with the national norms of minimum curriculum.

As possible next steps, we suggest a due diligence to understand and capture all the licenses attached to the materials within the Teachers Portal and a program of standardization and internal consistency.

VII.4. - The MeC Guide on Educational Technologies

Related Recommendations: “Content / Technology policy”, “Content/Pedagogy policy” and “Content / IPR”

The Technology Guide put together by the Ministry of Education provides a structured and revised set of technologies and materials that serve as a guide for the adoption of technologies within the public network of schools. MeC published calls for applicants who can present technologies in 5 main categories: Education Management, Learning tools, Training Tools for teachers, Tools for Inclusion and Portals. This Guide is one of the actions under the Education Development Plan to present to school TIC solutions.

However, there are no clear criteria regarding the adoption of these technologies, as each school has the autonomy to choose which technology they will adopt and present a plan and a budget to the Ministry that then supports the acquisition of the technology. The objective of the Ministry is to foster education technology production and adoption. Despite the fact that many of the technologies presented in the guide are free-software, there is no clear policy regarding the adoption of open licensed materials and open and free software or any kind of recommendation to adopt technologies, which are interoperable and facilitates the schools to work within a network.

VII.5. - Projeto Folhas

The Folhas Project is part of the State Secretariat for Education of Paraná (SEED)’s program focused on training the teachers of that southern Brazilian state. It was established in 2004 and is an effort to involve teachers in the development of educational materials. The objective is to establish a daily practice of research in schools, encouraging teachers to search the digital knowledge, and theoretical and methodological foundations of the disciplines they teach, producing texts to be used in the classroom.

The framework of this work is the curriculum of the Parana State. Once finalized, the text, called “Folhas”, is – after being verified and validated by the Educational Regional Nucleus (NRE) and by the SEED – published in the Dia-a-Dia (“Day by Day”) Educational Portal. This portal provides information and materials for teachers, students, schools and its communities. The texts, which can be developed via co-authorship, are published in the internal network of schools form Parana, and can be accessed and printed by the schools.

The “Folhas” are then organized in books – called “Public Textbooks” - that follow the content of the Parana state curriculum, and that are subject to the federal Law of Directives and Bases of Education. The State Secretariat for Education of Paraná do not

purchase the books listed by the National Program of Textbooks (PNLD) or the National Program of Textbooks for High School (PNLEM).

There are a total of twelve books attending the secondary school curriculum subjects: Art, Biology, Physical Education, Physics, Philosophy, Geography, History, Portuguese Language and Literature, Modern Foreign Language, Mathematics, Chemistry and Sociology. In order to distribute the books, the state publishes a call for bid.

In this case we see a clear program of incentives to participate in the Folhas project: (a) with the publication, the authors receive points that are counted in order to advance the career of that teacher; (b) the teachers are allowed to take some sabbatical time in order to write the Folhas and (c) they receive training and empowerment.

These Public Textbooks are free and available in digital format, and can be printed and distributed, if attribution is maintained. Inside of each book, the notice “it is allowed the total or partial reproduction of this work” can be seen. The program is analyzing the adoption of Creative Commons licenses.

VII.6. - SciELO Books

| Related Recommendations: “Content / Price” and “Content / IPR” |

The Open Access movement for scholarly literature is closely related to OER as it creates a growing corpus of peer-reviewed research for use in open courseware and elsewhere. One of the pioneers of Open Access journal publishing in developing countries, and a model of the effectiveness of regional collaboration in Open Access research dissemination, is the Scientific Electronic Library Online (SciELO) project from Brazil. SciELO is a leading open access journal aggregator focused on Latin America, and is now expanding its efforts via SciELO Books.

The SciELO Books program118 aims to create a consortium of academic publishers, including, in the pilot phase: UNESP (State University of Sao Paulo), UFBA (Federal

118 The case of SciELO: “The SciELO network of collections of scientific journals in open access and full text was launched in Brazil, in 1997. Since then it has been operated under the leadership of The State of Sao Paulo Research Foundation (FAPESP) and of the BIREME, and as from 2002, of the National Council for Scientific and Technological Development (CNPq). The SciELO network is present in 16 countries and provides approximately 600 journals. Only the SciELO Brazil Collection has 199 titles. The national and thematic SciELO collections in different countries are coordinated and financed by national and international organizations related to development and application of scientific research and communication. The SciELO network, with roughly 7 million articles visited per month, represents one of the outstanding collections of scientific journals published in open access in the developing world.”

University of Bahia) and FIOCRUZ (Oswaldo Cruz Foundation). The objective is the online publication of scientific works, focusing on out of print books, as well as new books. It will provide tools for publication, marketing, access, search, and interaction with users. A virtual store with mechanisms for the sale of books in both printed and electronic form (e-books) is being developed. The pilot will launch with 500 books. As of July 2009, SciELO had not yet secured all the funds needed to implement the project. In November 2009 we received the news Scielo has secured the necessary funds and the green light to develop Scielo Books. They are in a phase of platform evaluation and development. The adoption of Creative Commons is under analysis, however it may not affect the whole collection of books due to the business model involved (different in-print and out-of-print books and printing on demand).

VII.9. - Fundação Getulio Vargas Distant Learning – FGVOOnline

In July 2008, UC Irvine Extension – the continuing education arm of the University of California, Irvine – with the Fundação Getulio Vargas (FGV) announced a joint educational venture to provide online distance learning courses through UC Irvine Extension’s OpenCourseWare (OCW) initiative. Through the partnership, FGV – a private nonprofit higher education institution and the largest provider of online education in Brazil – has created free online courses, such as “Ethics” and “Training and Human Resources Development”, presented in Portuguese. As of January 2010 the list of courses has tremendous increase, and the list of free courses bring courses in disciplines such as law and management. The free courses do not ask for registration, do not allowed for download of printing of materials, and give a declaration that the student had completed it.

Said Gary W. Matkin, Ph.D., and dean of Continuing Education at University of California, Irvine: “The sharing of free, high-quality courses between two higher education institutions with international reach will benefit students all over the world. Exemplifying the power of the OCW initiative, this partnership enables learners, no matter whom or where they are, to gain access to University-level courses.”

For the project, FGV did not simply translate the courses, incorporating new distance-learning methodology and content. Regarding this improvement, Gary W. Matkin commented: “(…) since most educational material is shared from the Northern hemisphere to the Southern, this partnership provides us the opportunity to showcase high quality educational content produced in the vibrant countries of South America. The collaboration between UC Irvine Extension and FGV represents one of the first

times that an international institution has created content for utilization by the United States – making it an early example of both cultural significance and educational pioneering.”

The UC Irvine courses have been localized by adding concepts and cases that reflect the business and cultural environment of Brazil.

VII.10. – Pearson Brasil Copyleft

Pearson launched in Brazil at the end of 2008 the Pearson Copyleft Project. The site has received 78224 visits and is currently hosting 379 publications, which have been downloaded 7894 times. However, many aspects are still not clear or well delimited.

First, the content one may find in this site is not from Pearson. Pearson is just providing an upload/download platform that supports traditional formats, such as txt, xls, ppt, pps, doc, pdf, docx, xlsx, pptx, ppsx, not allowing generative effects of the knowledge web. Also, there is no specific copyright notice on the site or under the terms of use of the site.

The only place the user interested in using the content or author interested in sharing his work will find the issue of how his or her copyright will be treated and explored is under the site’s Q&A section. After reading 10 of the questions and answers related in some degree to copyright, we conclude that the project is accepting and distributing online content through something similar to a CC-BY-NC – however Creative Commons is not, at any moment, mentioned in the site. Pearson does not reserve to itself any right to the content that was voluntarily uploaded by authors. Questions regarding this and other issues the site brings up to face were sent to the contact email in the site, which has not yet been responded.

VIII. - Conclusions

Brazil is poised at a decisive moment to improve and democratize education and has in its hands a record total budget to invest. The moment is also favorable for such an improvement since:

“Educators worldwide are developing a vast pool of educational resources on the Internet, open and free for all to use. These educators are creating a world where each and every person on earth can access and contribute to the sum of all human knowledge. They are also planting the seeds of a new pedagogy where educators and learners create, shape and evolve knowledge together, deepening their skills and understanding as they go. This emerging open education movement combines the established tradition of sharing good ideas with fellow educators and the collaborative, interactive culture of the Internet. It is built on the belief that everyone should have the freedom to use, customize, improve and redistribute educational resources without constraint. Educators, learners and others who share this belief are gathering together as part of a worldwide effort to make education both more accessible and more effective.” (Cape Town Open Education Declaration, 2007)

Brazil is already a leader in issues such as Open Access, which are in many ways close to Open Educational Resources (OER). OERs are teaching, learning and research resources that reside in the public domain or have been released under an intellectual property license that permits their free use or re-purposing by others. In this sense, OERs include learning content, software tools to develop, use and distribute any kind of content, and implementation resources such as open intellectual property licenses. From the Cape Town Open Education Declaration: “These resources include openly licensed course materials, lesson plans, textbooks, games, software and other materials that support teaching and learning. They contribute to making education more accessible, especially where money for learning materials is scarce. They also nourish the kind of participatory culture of learning, creating, sharing and cooperation that rapidly changing knowledge societies need.”

Brazil is experimenting with this concept, but lacks a coherent set of functional goals and related policies governing the implementations of the OER idea. The result is a mismatch of projects, platforms, technologies and content that lack legal and technical interoperability. Much can be fixed and much can work better in the future if a uniform set of recommendations and protocols are adopted and mandated by the Ministry of Education and Federal Government – who is the biggest buyer and supporter of the educational material market in Brazil.
The leverage created by the Federal Government’s purchasing role is clear in the case of textbooks, at the equivalent to the “k-12” level. The Government has (but does not currently exercise in an OER context) significant market power through direct programs of purchase – and at the undergraduate and graduate equivalents levels – through the payment of scholarships, full-time salaries and the creation of tax exemptions affecting the whole publishing value chain.

However, the existing system simply creates closed resources in the print paradigm - unitary, single, paper-based books, which are slow to be updated, distributed, and corrected.

The system needs to be rethought and information needs to be disassociated from its “container” of the textbook. Adopting a modern and digital approach to generation of material allows for the publication of content to the web as well as into textbooks, and integration into modern Web technologies allows for crowd-based updates, corrections, extensions, addenda, and linkages, which both increases the return on investment in the original creation of material and creates opportunities for a participation-based culture in teaching and learning.

The market position occupied by the Government can and should be exercised to create precisely this kind of ecosystem of educational content. Materials, technology and projects should be planned in a consistent and non-redundant way for deployment onto the web as well as print. This both avoids unnecessary taxpayer expense and maximizes the chances of student, teacher, parent, and community empowerment in their own educational context.

It is essential for Brazil to develop new strategies for development, and education must be at the forefront of those new strategies. Brazil has the moment in time now to develop the strategies and implement the policies that can create a global leadership position in national education and development, one that recognizes the jump from the traditional systems of production and distribution of education, which restricts learning to physical spaces, to one that reaches all citizens with Internet connections.

Education is perhaps the greatest potential output of the Internet, and Brazil has a great chance to take the lead. But this leadership position will only come if Brazil has the courage and patience to develop and implement a coherent approach, using its power and its experience to create and nurture an entire system of content, technology, policy, and community.
